

oversized Ampere Altra machine to handle all ARM builds, as the current AArch64 setup on a Hetzner Cloud VM is nearing its capacity limits. These plans are still under consideration and not yet finalized.

## Red Hat teams up with Axiom Space to enhance space infrastructure

Red Hat, Inc., and Axiom Space, a pioneer in in-space infrastructure, have announced a collaboration on the latter's Data Center Unit-1 (AxDCU-1), set to launch to the

International Space Station in spring 2025. Powered by Red Hat Device Edge, this data processing prototype will conduct experiments on the space station, showcasing initial capabilities of an Orbital Data Center (ODC). The prototype will

test applications in cloud computing, artificial intelligence and machine learning (AI/ML), data fusion, and space cybersecurity, marking a significant step in Axiom Space's mission to develop transformative space infrastructure.

Red Hat Device Edge combines an enterprise-ready distribution of MicroShift, a lightweight Kubernetes solution derived from Red Hat OpenShift, with Red Hat Enterprise Linux and Red Hat Ansible Automation Platform. This powerful combination will enable Axiom Space to deploy hybrid cloud applications and cloud-native workloads in orbit, revolutionising how data is processed and analysed in space.

Axiom Space's ODCs aim to deliver tangible benefits to humanity on Earth by reducing the delays traditionally associated with orbital data processing. By leveraging Earth-independent cloud storage and edge processing infrastructure, ODCs will process data closer to its source—spacecraft or satellites—eliminating the need to rely on terrestrial data centres. This approach reduces dependence on costly, slow, or unreliable network connections, enabling faster and more secure decision-making in space.

Potential use cases for ODCs include supporting Earth observation satellites with in-space data storage and processing, conducting AI/ML training in orbit, enabling multi-factor authentication and cyber intrusion detection, facilitating supervised autonomy, performing in-situ space weather analytics, and providing off-planet backup and disaster recovery for critical Earth-based infrastructure.

Tony James, chief architect, science and space, Red Hat Inc., said: "Off-planet data processing is the next frontier, and edge computing is a crucial component. With Red Hat Device Edge and in collaboration with Axiom Space, Earth-based mission partners will have the capabilities necessary to make real-time decisions in space with greater reliability and consistency."

## Red Hat announces a global collaboration with Fujitsu for AI-ready vRAN solution

Red Hat, Inc., has announced a global collaboration with Fujitsu to deliver a virtualized radio access network (vRAN) solution on Red Hat OpenShift, the hybrid cloud application platform powered by Kubernetes. Fujitsu has selected Red Hat OpenShift as its preferred hybrid cloud platform to provide a cloud-native, AI-ready vRAN solution, designed to help service providers enhance efficiency, optimise networks, and expand operations across diverse applications with greater consistency and flexibility.

This partnership positions Red Hat OpenShift as the foundation for Fujitsu's O-RAN O-Cloud-based solution, a cloud-native platform that supports virtualised and containerised open RAN functions, along with software components and AI workloads for RAN. Deploying and managing RAN at scale—often spanning thousands of sites within a service provider's network—demands advanced automation, flexibility, and security.

## SUSE's new solution integrates SUSE AI with Infosys Topaz

SUSE has announced a new all-in-one solution that integrates SUSE AI, its extensible and secure open infrastructure platform for AI workloads, with Infosys Topaz, a suite of generative AI-based solutions from Infosys. Infosys Topaz is an AI-first offering designed to help global enterprises accelerate business value using generative AI, providing a comprehensive set of services, solutions, and platforms. Together, SUSE AI and Infosys Topaz offer customers a complete solution to build, deploy, and scale AI applications tailored to their business needs. This collaboration enables efficient AI scaling, data control, and rapid innovation without compromising security, delivering an end-to-end stack to drive business outcomes and efficiencies through generative AI technologies.

The partnership leverages the AI Guardrails ethical and regulatory framework, integrating the Infosys Responsible AI Toolkit with the SUSE AI platform. AI Guardrails combines enhanced ethical AI practices with the security and observability of the SUSE AI platform, ensuring data privacy, regulatory compliance, and transparency in AI workloads. The open source toolkit is flexible, easy to implement, fully customisable, and compatible with diverse models and agentic AI systems. It seamlessly integrates across both cloud and on-premises environments.

Balakrishna D.R., executive vice president, global services head, AI and industry verticals at Infosys, commented on the collaboration: "The Infosys Responsible AI Toolkit ensures that businesses remain resilient and trustworthy amidst the AI revolution. By making the Responsible AI toolkit open source, we are fostering a collaborative ecosystem to tackle the complex challenges of AI bias, opacity, and security. Teaming up with SUSE on this new solution will help our joint global enterprise customers explore the vast possibilities of AI."
