

as landing pages, payment pages, and basic connections, and templates with features for product listings, checkout, and payment gateways for e-commerce platforms.

Q. Could you elaborate on the role of the community in the development of this framework?

A. The Golang community has been instrumental in the language's growth. The Gofr.dev framework has been built over the past decade, recently being open sourced, as it accelerates development. With hundreds of developers contributing ideas and code, the framework evolves faster. The collective opinions and experiences of the community help in identifying what features should or should not be included, enhancing the framework's capabilities and adaptability.

Q. How do you manage contributions from different groups within the community?

A. The core team plays an important role in maintaining the integrity of the framework. While we are open to community contributions, not everything is accepted. We follow an opinionated approach, ensuring that only features beneficial for microservices are integrated. Contributors are required to provide proof, documentation, and examples of how their proposals align with the needs of developers and companies using Gofr.dev.

At the same time, we value the community's input and have incorporated many features based on their suggestions. Decisions are made keeping in mind the best interests of Gofr.dev users, the Golang community, and the broader microservices ecosystem. Our goal is to ensure that the framework evolves in a structured way without compromising its core principles.

Q. What kind of initiatives are you engaging in to get the community on board and make it bigger?

A. One of our primary efforts includes participating in conferences. These face-to-face interactions allow us to explain the framework, its benefits, and how it works directly to developers. We organise hackathons, so that developers can experiment with ideas ranging from AI and blockchain to other emerging technologies, using Gofr.dev to build projects.

We are also attending international conferences. For example, a team member recently presented at Gophercon Africa in Kenya, a major event that helped us showcase Gofr.dev to a wider audience.

Q. How does the framework support AI-based applications?

A. AI applications often involve 'prompt chaining', where multiple API calls are made in sequence. Managing such dependencies manually can be challenging, as each step depends on the successful execution of the previous one. Gofr.dev simplifies this process through its built-in dependency management. It ensures that subsequent prompts only run when the preceding ones have completed successfully.

Even when integrating external AI tools like OpenAI, Gofr.dev ensures seamless API calls. For instance, it checks whether OpenAI's services are responsive before making requests, avoiding unnecessary charges for failed responses. This observability and control allow developers to build reliable, cost-efficient AI applications.

Q. How does Gofr.dev address security concerns, especially in the context of open source?

A. Security and transparency are top priorities for Gofr.dev. All the dependencies and packages

used within the framework are official and thoroughly vetted. Any packages developed internally go through three levels of testing to ensure they do not break or introduce vulnerabilities.

To further ensure security compliance, tools like Snyk and similar applications are employed to scan for vulnerabilities and ensure the framework remains secure. This commitment to security ensures developers can confidently use Gofr.dev for production-grade applications.

Q. What advice do you have for developers who want to get started with Gofr.dev?

A. Getting started with Gofr.dev is incredibly simple. All you need to do is visit our GitHub repository and follow the instructions. It will likely take you less than five minutes to set up and start using the framework. The instructions are straightforward, even for developers who are not familiar with frameworks.

For developers exploring AI-assisted code generation, Gofr.dev is also highly compatible. You can copy the documentation, feed it into tools like OpenAI or Claude, and generate the code you need. This makes it easier for developers transitioning to microservices or those experimenting with AI-driven workflows.

Q. What does the future hold for Gofr.dev?

A. The future of Gofr.dev is focused on growth and ease of use. We aim to release templates for common application types to help developers start projects quickly. We will be introducing one-click deploy functionality for ZopDev for deployment across small applications. We will also continue engaging with the developer community to refine the framework and ensure it meets real-world needs.

Ultimately, our goal is to make Gofr.dev the go-to choice for building microservices with Golang, empowering developers to build scalable, secure, and efficient applications with ease. **END**
