threat hunting, and vulnerability detection. Cloud security features include posture management, container security and workload protection.

Wazuh integrates comprehensive security mechanisms for multiple endpoints and digital infrastructure and can be used for high performance security and privacy-based applications.

MISP (<https://www.misp-project.org/>)

MISP is a high-performance platform for threat intelligence, analytics and evaluations using AI for detection and correlation of cyber threats.

It is used in a range of digital forensics-based applications for storage, sharing and collaborating on malware and cyber security-based operations. It works on the analytics and prevention of cyber frauds, threats, and attacks.

Network traffic analysis and intrusion detection tools

Zeek (zeek.org/)

Zeek is an AI integrated traffic analysis and network monitoring tool. The platform is used for analytics and prediction of malware and suspicious traffic in the network and digital infrastructure.

Snort (snort.org/)

This is an intrusion detection system (IDS) for detecting network threats. AI based models can use it for network management and analytics.
