

Table 1: Cybersecurity tools offered in Parrot Security OS

Tool name	Security category	Tool description
Metasploit Framework	Penetration testing	Widely used tool for penetration testing, exploit development, and vulnerability assessment.
Burp Suite	Web security testing	Powerful web security testing tool widely used by penetration testers, ethical hackers, and security researchers.
SQLmap	Database security	Open source automated SQL injection tool that helps penetration testers and ethical hackers detect and exploit SQL injection vulnerabilities in web applications.
Aircrack-ng	Wireless security	Powerful wireless security tool designed for Wi-Fi network penetration testing. It allows ethical hackers and security professionals to assess the security of wireless networks by capturing and cracking Wi-Fi encryption keys.
Autopsy	Digital forensics	Designed for investigating and analysing hard drives, memory dumps, and digital evidence. It provides a graphical user interface (GUI) for The Sleuth Kit (TSK), making it easier for forensics investigators to examine digital artifacts.
Volatility	Memory forensics	Volatility is an advanced memory forensics tool designed for analysing RAM dumps to investigate malware infections, cyberattacks, and forensics evidence. It is widely used by digital forensics experts and incident response teams to extract valuable information from volatile memory.
Wireshark	Network analysis	Wireshark is a powerful network protocol analyser widely used by cybersecurity professionals, network administrators, and penetration testers for packet analysis, network troubleshooting, and security auditing. It captures and inspects network traffic in real-time, helping identify security vulnerabilities and suspicious activities.
ExifTool	Metadata analysis	ExifTool is a powerful metadata analysis tool used for extracting, editing, and analysing metadata from various file formats. It is widely used by digital forensics experts, photographers, and cybersecurity professionals for investigating image authenticity, document metadata, and hidden data within files.
John the Ripper	Password cracking	This password cracking tool is widely used by ethical hackers, penetration testers, and cybersecurity professionals for testing password strength and recovering lost passwords. It supports multiple attack techniques, including brute-force, dictionary, and rainbow table attacks.
Hashcat	Password cracking	This advanced password recovery and cracking tool is known for its high-speed performance and GPU acceleration. It is widely used by ethical hackers, penetration testers and forensics investigators to test password strength and recover lost credentials.
GPG (GNU Privacy Guard)	Cryptography	This open source encryption and cryptographic tool is used for secure communication, data encryption, and digital signatures. It is widely used by cybersecurity professionals, activists, and privacy advocates to protect sensitive information.
Tor	Anonymity and privacy	This privacy-focused network tool is designed for anonymous browsing, secure communication, and censorship circumvention. It routes internet traffic through multiple encrypted relays, making it difficult to trace users' online activities.
Anonsurf	Anonymity and privacy	This privacy and anonymity tool is designed to route all internet traffic through Tor and enhance user privacy by anonymising network connections. It is widely used by ethical hackers, penetration testers, activists, and privacy-conscious users to hide their online activities.
Proxy-Chains	Network security	This powerful network anonymity tool is used to route internet traffic through multiple proxy servers (such as SOCKS4, SOCKS5, and HTTP proxies). It helps ethical hackers, penetration testers, and privacy-conscious users hide their IP addresses and bypass restrictions.
Maltego	Intelligence gathering	It is an open source intelligence (OSINT) and data visualisation tool included in Parrot Security OS, widely used by cybersecurity professionals, penetration testers, forensics investigators, and law enforcement agencies for network mapping, threat intelligence, and digital forensics.
Nmap	Network scanning	This powerful network scanning and reconnaissance tool is widely used by penetration testers, ethical hackers, system administrators, and cybersecurity professionals for network discovery, vulnerability assessment, and security auditing.
