

OpenSource DB names new VP

OpenSource DB has appointed Sovenath S. as the vice president of customer and partner success. He brings extensive experience in open source databases and customer engagement, with a focus on building strong relationships and supporting business growth.

Sovenath has worked extensively in the open source database sector, with expertise

in customer success strategies, collaboration, and long-term engagement. His role will involve working with customers and partners to improve their experience with PostgreSQL solutions and related services.

At OpenSource DB, the goal is to provide more than just database solutions—ensuring that customers and partners receive the necessary support and resources to effectively utilise PostgreSQL technologies. Sovenath’s leadership is expected to contribute to these efforts by fostering a more connected and informed user base.

His appointment aligns with the company’s ongoing focus on strengthening customer relationships and expanding its network of partnerships.

Three leading financial institutions join the Global Synchronizer Foundation

The Global Synchronizer Foundation (GSF), in partnership with the Canton Network—the world’s only public layer-one blockchain network offering both control and privacy—has announced that Goldman Sachs, Hong Kong FMI Services Limited, and Moody’s Ratings have joined as its newest members. This expansion highlights the increasing trust and momentum the Canton Network is building within the financial services industry.

The decision by these leading institutions to join the GSF comes at a critical juncture for the Canton Network, as interest in tokenized assets continues to surge and market leaders aim to harness the potential of synchronised financial markets. Their participation underscores the growing adoption of a decentralised financial infrastructure that emphasises privacy, control, and seamless interoperability.

“On behalf of the Global Synchronizer Foundation, I am pleased to welcome our new members and their valuable industry perspectives. Each of them contributes to strengthening the governance while ensuring the Global Synchronizer of the Canton Network remains an open, fair, and trusted blockchain infrastructure,” said Jorgen Ouaknine, GSF chairperson and global head of innovation & digital assets at Euroclear.

“Joining the Global Synchronizer Foundation aligns with our ongoing commitment to driving blockchain innovation in regulated financial markets,” said Mathew McDermott, global head of Goldman Sachs Digital Assets.

“Our participation in the GSF highlights a significant step in our robust digital economy preparedness strategy,” said Fabian Astic, managing director and global head of digital economy at Moody’s Ratings. “This collaboration underscores our

Eclipse Foundation releases Theia AI

The Eclipse Foundation has unveiled Theia AI, an advanced open framework that empowers developers and tool builders with AI-driven capabilities—without vendor lock-in. Contributed by EclipseSource, this launch introduces Theia AI (public release), an open framework that enables seamless integration of large language models (LLMs) into custom tools and IDEs, supporting agentic workflows, AI-driven suggestions, and intelligent automation. The AI-powered Theia IDE (Alpha release) is an AI-enhanced development environment built on Theia AI, designed to boost productivity while ensuring full transparency and control.

Theia AI allows developers to integrate AI on their own terms. They can select the LLM of their choice—cloud-based, self-hosted, or local—while defining AI behaviours, managing data access, and customising AI-driven workflows. This ensures full transparency, adaptability, and alignment with domain-specific needs.

With this IDE, tool builders can design AI-powered user experiences, from intelligent chat assistants to AI-driven code editing and automation. The framework streamlines AI integration, helping developers build advanced and highly customisable solutions.

The AI-powered IDE’s AI features include intelligent coding assistants, flexible LLM support, contextual integration, and licence compliance. SCANOSS integration ensures AI-generated code adheres to open source licences. Unlike proprietary solutions, the IDE prioritises developer control, allowing for full transparency and customisability.
