

OpenText launches AI-powered cybersecurity solution

OpenText has announced the general availability of OpenText Core Threat Detection and Response alongside Cloud Editions 25.2. This new AI-powered cybersecurity solution enhances an enterprise's ability to detect and mitigate threats before they cause harm.

As cyber threats become more sophisticated, OpenText continues to strengthen its security offerings, helping organisations defend against both external attacks and insider threats. OpenText Core Threat Detection and Response is designed to work seamlessly with Microsoft Azure, integrating with Microsoft Defender for Endpoint, Microsoft Entra ID, and Microsoft Security Copilot. Additionally, OpenText's Threat Integration Studio enables organisations to ingest telemetry from various network solutions, security tools, and enterprise applications into a unified detection framework.

The OpenText Cybersecurity Cloud addresses diverse security challenges, including application and data protection, identity and access management, security operations, and digital forensics. "Enterprises need a way to continuously adapt threat analysis to their unique environment without overburdening security teams," said Muhi Majzoub, EVP, security products at OpenText. "Our composable open XDR architecture ensures seamless integration with existing security tools for identity management, data loss prevention, and endpoint protection."

Currently, OpenText Core Threat Detection and Response is available as a limited release to select customers.

commitment to helping market participants understand the risks and opportunities of digital finance, and to meeting stakeholders where they are in their preferred digital channels. It also provides us with an opportunity to further engage with leading institutions working towards enhanced transparency, security, and scalability in the digital financial markets of the future."

Honda and KernelCI join the ELISA Project

The ELISA (Enabling Linux in Safety Applications) Project has welcomed Honda and KernelCI into its ecosystem. This partnership represents a major step forward, as both organisations join forces to strengthen their dedication to Linux and its application in safety-critical systems. Hosted by the Linux Foundation, ELISA is an open source initiative focused on developing a common framework of components, processes, and tools to enable companies to create and certify Linux-based solutions for safety-critical applications. By collaborating with Honda and KernelCI, ELISA continues to drive innovation and reliability in functional safety, particularly in the automotive industry and beyond.

"The automotive industry heavily relies on open source software, and Linux is becoming a foundational pillar for safety-critical applications," said Philipp

Ahmann, senior open source software community manager at ETAS and chair of the ELISA Project Technical Steering Committee. "By leveraging rigorous testing, automation, and industry collaboration, we can ensure that

Linux meets the strong requirements of functional safety standards while driving innovation, reliability, and maintainability in modern vehicles. With Honda's 'power of dreams' and their technical excellence, we have no doubt that they will help the ELISA Project meet many milestones this year." Honda has been actively integrating Linux-based solutions into its automotive technologies, focusing on enhancing in-vehicle infotainment and connectivity.

KernelCI is a community-based open source distributed test automation system focused on building a collaborative ecosystem around upstream kernel development. Its primary goal is to use an open testing philosophy to ensure the quality, stability and long-term maintenance of the Linux kernel. The project is currently working on improved LTS kernel testing and validation, consolidation of existing testing initiatives, quality-of-life improvements to the current service, expanded compute resources, and an increased pool of hardware to be tested.

"KernelCI is already collaborating with the Linux kernel community to build a service and ecosystem to tackle the challenges of testing," said Don Zickus, chair of the KernelCI Advisory Board. "Expanding our efforts to include ELISA's goals is a natural fit and we are excited to pursue this journey with them."

Red Hat announces general availability of Red Hat OpenShift 4.18

Red Hat, Inc., has announced the general availability of Red Hat OpenShift 4.18, the latest version of its hybrid cloud application platform powered by Kubernetes. This release introduces new features and capabilities aimed at streamlining operations, enhancing security, and delivering greater consistency across IT environments for all types of applications—from cloud-native and AI-enabled to virtualised and traditional workloads.

According to Gartner's *Top Trends Impacting Infrastructure and Operations for 2025*, revirtualization and devirtualization are among the top trends shaping the future of IT infrastructure. Red Hat OpenShift 4.18 addresses these trends by providing
