

Convergence with other technologies: Cloud computing and edge computing technologies, as well as the Internet of Things (IoT), are being increasingly associated with Python. This allows for a greater integration of AI models into various platforms. The versatility of Python guarantees it will remain a strong contender as these ever-expanding technologies evolve.

Progress in deep learning: Deep learning advancement is now nourished by Python. TensorFlow, PyTorch, Keras, and others continue to grow in functionality to support more advanced deep learning models, thereby allowing researchers to design more complex models. Python will continue to be the first choice of developers and researchers working on next-gen deep-learning projects as the AI sector evolves.

Automation of ML pipelines: Whether referred to as MLOps or automated machine learning pipeline, this trend is gaining traction. Python libraries such as MLflow and Kubeflow are facilitating the construction, testing, and deployment of ML models so that team members can collaborate easily and optimise processes. This transition to automation means developers will be able to spend less time on the nitty-gritty of pipeline management and more on high-level problem-solving.

AI for the people: Python increasingly acts as a bridge that allows access to AI and ML by people who

are not computer scientists. Libraries that have simplicity at heart like scikit-learn, Keras, and fast.ai, are making this possible. Hence, more and more people will start contributing openly to AI-based solutions, driving innovation and creativity.

Ethical AI and fairness: With AI entering our daily lives, questions of fairness, ethics, and bias have never been more pressing. Python is a leader in providing tools and environment to curb bias in AI models. It supports packages like Fairlearn and AIF360 for building transparent, fair, and inclusive AI systems, and this focus will only grow in the foreseeable future. **END** 🐧

By: Rupam Bhattacharjee

The author is a data and analytics professional with 12 years of experience in the industry. He specialises in machine learning, artificial intelligence, and data-driven solutions, and is passionate about leveraging emerging technologies like generative AI to solve complex problems and drive innovation. His expertise spans Python programming, data management, and automation.
