

openSUSE celebrates 20 years of open source innovation

The openSUSE project is marking 20 years of open source excellence, and is inviting contributors and community members around the world to join in the celebration.

Since its launch on August 9, 2005, openSUSE has grown into a global movement, powering desktops, servers, and development environments across a wide spectrum of users and industries. To honour this vibrant legacy, the project is calling on its community to share their favourite memories and milestones from the past two decades.

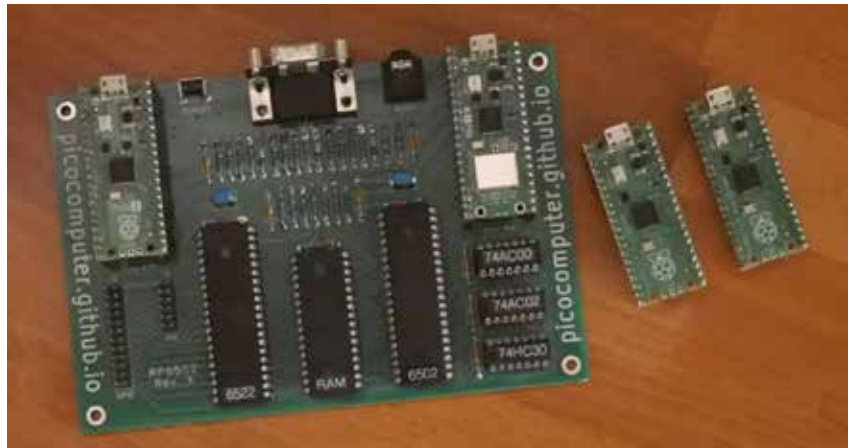

To highlight the spirit of the community, the openSUSE team is collecting up to 20 images per contributor that reflect the journey—from conferences and hackathons to meetups, swag collections, and personal moments. These photos will be featured in community presentations and showcased during events to celebrate the 20th anniversary.

“This is a celebration of the people who have made openSUSE what it is today,” said the organisers.

There are several ways to participate in the celebration. You can submit up to 20 high-resolution images, celebrate locally by organising small events or meetups in your town, share celebration photos for inclusion in news, social media, and presentations; or help present openSUSE’s 20-year history at community summits and conferences.

A dedicated presentation using the submitted images will be made available on the openSUSE Wiki, enabling community members to tell the openSUSE story at various events around the globe. Additionally, attendees of the upcoming openSUSE Asia Summit will have a chance to win exclusive 20th Anniversary t-shirts by participating in a fun community quiz.

At its core lies the W65C025, a modern incarnation of the MOS Technology 6502, alongside one Raspberry Pi Pico (RP2040) acting as an I/O adapter, with an optional second board for graphics. This architecture gives users a taste of 1980s-era computing, with today’s tools.

With the upgrade to the Pico 2 W, the RP6502 interface adapter gains integrated Wi-Fi, enabling functions like network time synchronisation, modem emulation, and remote BBS access. While no one’s browsing the web on this device, the upgrade delivers a compelling blend of nostalgia and function, giving retro enthusiasts new avenues to explore.

For electronics hobbyists, the RIA W offers a seamless way to modernise a vintage-style project without abandoning its charm. It keeps the look, feel, and interaction model of 1980s microcomputers intact, but brings it online. Enthusiasts can now sync clocks, download files over the air, and emulate classic modem experiences over Wi-Fi.

Linux Foundation strengthens cloud leadership

In a move to strengthen its leadership in open source cloud and infrastructure technologies, the Linux Foundation has appointed Jonathan Bryce as executive director, cloud & infrastructure, and Chris Aniszczyk as chief technology officer (CTO), cloud & infrastructure. Both executives will oversee major open source initiatives, including the Cloud Native Computing Foundation (CNCF), where Bryce will also take charge as executive director.

Jonathan Bryce, who continues to serve as executive director of the OpenInfra Foundation, brings extensive experience in building open source infrastructure communities. He will now be responsible for setting strategic direction across
