

cloud native, AI, and infrastructure projects under the Linux Foundation. His goal is to foster sustainable growth and address emerging needs in areas such as generative AI, edge computing, and digital transformation.

Chris Aniszczyk, already an established leader within CNCF, will expand his role as CTO to support broader developer-facing efforts. His focus will be on scaling successful practices from CNCF to other Linux Foundation projects, including OpenInfra. Aniszczyk aims to strengthen developer engagement and promote innovation through open collaboration.

Linux Foundation executive director Jim Zemlin highlighted the complementary strengths of both leaders, stating that their combined experience will bring fresh energy and alignment across various open source projects critical to modern technology infrastructure.

As the new executive director of CNCF, Bryce will work with over 700 member organisations and more than 200 open source projects. He emphasised the potential for closer collaboration between CNCF and OpenInfra, two communities that are central to supporting AI, cloud native, and edge workloads.

“The Linux Foundation hosts some of the most important open source technologies globally. My focus is on ensuring the continued health, scale, and relevance of these projects,” said Bryce. Aniszczyk added that developers remain the foundation of open source innovation and that he will aim to empower them across ecosystems. This leadership reshuffle underscores the Linux Foundation’s commitment to accelerating open source innovation in critical areas of cloud computing and infrastructure.

Microsoft open sources GitHub Copilot Chat extension for VS Code

Microsoft has open sourced the GitHub Copilot Chat extension for Visual Studio Code, releasing it under the MIT licence on GitHub. This move grants developers

full access to the implementation of the chat-based coding assistant, including its ‘agent mode’, the contextual data shared with large language models (LLMs), and the structure of system prompts.

The repository also provides transparency around telemetry data collection, addressing ongoing concerns about privacy and data use in AI-assisted development tools.

This release marks the first major step in Microsoft’s broader plan—announced in May 2025—to embed AI features directly into Visual Studio Code, one of the world’s most popular open source code editors. Launched in 2015 and built on the Electron framework, VS Code supports numerous programming languages and extensions.

GitHub Copilot Chat, powered by GPT-4, allows developers to interact with an AI assistant directly within VS Code. The tool has gained significant traction, with over 35 million installations, driven by the rapid adoption of LLM-based coding and emerging trends like ‘vibe coding’.

The VS Code team noted that the growth of open source AI tools and a more balanced innovation landscape have reduced the need for secrecy around UI design and prompt engineering. Simultaneously, the increasing risk of threats targeting developer tools has made openness a strategic choice for faster issue resolution and better security.

OpenELA launches ELValidated

OpenELA has announced the release of ELValidated, a new open source verification and interoperability suite designed to help Enterprise Linux vendors and developers reduce testing costs, streamline resource usage, and ensure consistent compatibility across distributions.

ELValidated enables organisations to verify that their Enterprise Linux (EL) distributions align with binary compatibility standards, providing a clear benchmark for compatibility with other EL platforms. The toolkit targets both system vendors and application developers, helping to minimise risk while expanding end-user choice and confidence in Linux environments.

“The introduction of ELValidated marks one of OpenELA’s initial goals: to set the standard for Enterprise Linux distributions and give users full confidence in their choice of a distribution,” said Greg Marsden, senior vice president of Linux Development at Oracle and member of the OpenELA board.

Built on industry-standard technologies, ELValidated checks Application Binary Interfaces (ABIs) for critical libraries and packages against published standards hosted by OpenELA. This allows vendors to ensure that their distributions maintain consistent binary compatibility with the broader Enterprise Linux ecosystem.

The suite is especially beneficial for independent software vendors, independent hardware vendors, and Linux developers. OpenELA has made compatibility reports and documentation available via GitHub.
