

Red Hat launches RHEL for Business Developers

Red Hat has announced Red Hat Enterprise Linux for Business Developers, a new self-service offering aimed at simplifying access to its flagship enterprise Linux platform for development and testing. Available through the Red Hat Developer Program, this offering enables business development teams to build, test, and iterate applications on the same platform used in production, at no cost.

As modern IT environments become increasingly complex—with applications spanning physical, virtual, cloud, and edge infrastructures, alongside the rise of AI, cloud-native, and virtualised workloads—maintaining consistency between development and production has become more critical than ever. This challenge is compounded by a growing cybersecurity threat landscape, including rising

software vulnerabilities and software supply chain attacks, as highlighted in Red Hat's latest Product Security Risk Report.

Gunnar Hellekson, vice president and general manager, Red Hat Enterprise Linux,

Red Hat said: “Modern developers need to be able to move at their own pace to deliver innovative applications but must do so without increasing friction with IT operations teams or production systems. Red Hat Enterprise Linux for Business Developers helps empower developers with direct access to the world's leading enterprise Linux platform without having to move through centralised IT channels, giving them a more consistent, reliable foundation that aligns with the business' demands for production-readiness.”

Red Hat Enterprise Linux for Business Developers aims to address these challenges by offering developers free, self-service access to enterprise-grade RHEL content for use within their organisations. The result is a more consistent, reliable environment for both development and operations teams, regardless of where their applications are ultimately deployed across the hybrid cloud.

Fact8ra selects openSUSE as a core component of its sovereign AI platform

Europe's first federated AI initiative, Fact8ra, has officially selected openSUSE as a foundational element of its sovereign AI platform.

Announced by OpenNebula Systems, Fact8ra is Europe's first federated AI-as-a-Service platform, developed under the €3 billion Important Project of Common

GParted Live 1.7.0-8 released with improved block device handling

The GParted team has announced the release of GParted Live 1.7.0-8, the latest version of the live distribution for this powerful open source partition manager. Built on the robust GParted (GNOME Partition Editor) application, GParted Live enables users to resize, copy, and move partitions without data loss. This new release is powered by the Linux kernel 6.12.37-1 and is based on the Debian Sid (Debian 13) snapshot as of July 12, 2025.

Arriving five and a half months after version 1.7.0-1, GParted Live 1.7.0-8 introduces a key improvement: a mechanism that reduces the likelihood of block devices appearing in a random order during live system sessions. This enhancement aims to improve consistency and reliability when identifying and managing disk devices.

As the second release in the 1.7 series, it continues building on earlier updates, including experimental Bcachefs support, recognition for NBDs (network block devices), and a safeguard to prevent GParted from automatically activating LVM volume groups during probing. The 1.7 branch also improved exFAT file system support by integrating with exfatprogs 1.2.3 or newer, raised the minimum required version of libparted to 3.2, resolved a hang issue caused by missing btrfs-progs, and updated its continuous integration systems for Ubuntu 24.04 LTS and Rocky Linux 8.

GParted Live remains a reliable tool for partitioning tasks, now with better control over device ordering in live environments.
