

Figure 3: Run backup

Figure 4: Confirming the presence of backups

following block into the text box:

```
--send-mail-url=smtp://smtp.gmail.
com:587/?starttls=when-available
--send-mail-any-operation=true
--send-mail-subject=Duplicati
%PARSEDRESULT%, %OPERATIONNAME% report
for %backup-name%
--send-mail-to=dest_email@gmail.com
--send-mail-username=sender_email@gmail.
com
--send-mail-password=sender_password
--send-mail-from= sender_email@gmail.com
```

Then click on *Edit as list* to review the individual options.

Replace placeholder values: To configure email notifications, update the following four fields in the settings. Replace *dest_email@gmail.com* with the email address where you want to receive backup notifications. Then, replace *sender_email@gmail.com* with your own Gmail address in both the *username* and *from* fields. Enter your Gmail App Password in place

of *sender_password*—note that this should be a generated app-specific password, not your regular Gmail login. Once all fields are updated, click *OK* at the bottom of the screen to save the changes.

Test the setup: Run any backup job. You should receive an email summary shortly after it finishes. The message will include the result (success, error, warning), the type of operation, and the name of the job.

Note: Gmail requires App Passwords if 2-step verification is enabled on your account. Generate one under your *Google Account* → *Security* → *App Passwords*.

With this setup, Duplicati will automatically send an email report after every operation, helping you stay informed about the health and success of your backup system.

Final verification and maintenance

Once your backup system is active and sending email notifications, it is still important to periodically check its performance and verify that your data remains recoverable. Here are some basic steps for monitoring your setup and confirming that backups are working as expected.

Review backup logs: Duplicati maintains a detailed log for each backup job, allowing you to review what happened during each run. To access the logs, open the Duplicati web interface, click on your backup job, and select ‘Show log’. You can then navigate through the *General*, *Remote*, or *Errors* tabs to view specific details about the backup process.

The log provides information such as the number of files backed up, total data transferred, duration of the backup, and any warnings or errors. Reviewing these logs regularly helps identify problems early.

Check backup files on server: On your Ubuntu backup server, you can inspect the stored backup files
