to confirm that data is arriving as expected. Use the following command to check storage usage:

```
$ du -sh /home/backupuser/duplicati-backups
```

```
$ ls -lh /home/backupuser/duplicati-backups
```

This helps ensure backups are growing over time and not stuck.

Perform periodic test restores:

A backup is only useful if it can be restored. So every few weeks, select a random file from a recent backup, use Duplicati's *Restore* feature to recover it, and confirm that the file opens correctly and is not corrupted. This simple habit helps ensure that your backup system remains reliable and your data can be recovered in case of a real emergency.

This guide showed how to set up a complete and reliable data backup system for a small office or home office (SOHO) using free and open source software. With this system in place, your files are safely stored, easy to recover, and protected from unexpected data loss.
