

Cloud Cost Governance

Using Kubecost, OpenCost, and Infracost

Explore how combining Kubecost, OpenCost, and Infracost into a unified workflow can improve cloud cost management.

Managing related expenses has become a crucial issue for businesses as cloud infrastructure grows more widespread and complex. Effective monitoring, forecasting, and cost control are made more difficult by the dynamic nature of cloud environments, which include numerous services, scaling resources, and a variety of deployment models. Without proper cloud cost visibility and governance, organisations risk budget overruns, resource wastage, and misaligned financial planning.

When it comes to offering real-time insights or smoothly integrating into development workflows, traditional

cost management techniques frequently fall short. The open source community provides a set of potent tools for cloud cost visibility and optimisation to address these problems. Within Kubernetes environments, Kubecost and OpenCost provide comprehensive, real-time cost analytics that let teams keep a close eye on expenditures. By incorporating cost estimates into the development process, Infracost enhances these and enables proactive budget management throughout the infrastructure planning phase.

This practical workflow aims to unify these open source solutions to establish an effective cloud cost

governance framework. Organisations can obtain a thorough understanding of their cloud expenses by integrating ongoing monitoring and analysis during runtime with cost estimation during development. Using affordable, community-supported tools, this method enables teams to enforce financial policies, optimise resource usage, and make data-driven decisions.

Comprehending cloud cost governance (CCG)

CCG describes the methodical procedure for monitoring, managing, and maximising cloud spending to make sure it complies with corporate budgets,
