

Python Software Foundation rejects US government grant citing restrictive anti-DEI clauses

The Python Software Foundation (PSF) has rejected a \$1.5 million grant from the US National Science Foundation (NSF), taking a firm stand for open source ethics and inclusivity. The decision followed the NSF's demand that the Foundation affirm it would "not operate any programs that advance or promote DEI [diversity, equity, and inclusion]" for the duration of the award, a restriction that would have applied to all PSF activities, not just the funded work.

The grant was intended to strengthen Python's software supply chain security, build a proactive automated review system for PyPI packages, and develop tools transferable to other open source ecosystems. However, the conditions included a clawback clause allowing the NSF to reclaim funds if the PSF was found in violation of the anti-DEI terms, creating what the Foundation described as an "open-ended financial risk."

"These terms included affirming the statement that we 'do not, and will not... operate any programs that advance or promote DEI,'" said Loren Crary, deputy executive director of the PSF. "This would create a situation where money we'd already spent could be taken back, which would be an enormous, open-ended financial risk."

The board voted unanimously to withdraw the application, reaffirming its commitment to a diverse, international community of Python developers.

Indian open source contributors outnumber US developers on GitHub

India has officially overtaken the United States to become the world's largest base of open source contributors, according to GitHub's Octoverse 2025 report. This marks the first time any nation has surpassed the US in open source contribution volume, signalling a new era in global software collaboration.

"India added more than 5.2M developers in 2025, which accounts for a little over 14% of GitHub's total +36M new developers in 2025. That makes India the single largest source of new developers on GitHub this year, continuing its rapid rise since 2020," the report stated.

GitHub projects that by 2030, India will have over 57 million developers, equivalent to one in every three new developers globally. While India leads in developer headcount, the United States continues to top contribution volume, reflecting higher per-developer activity.

Brazil, Indonesia, and Germany have also emerged as significant open source hubs, marking a geographic shift in global software innovation.

PepsiCo enhances its open source platform to boost farmer resilience to climate change

PepsiCo has expanded its Climate Resilience Platform (CRP), an open access, open source tool designed to help farmers plan for and adapt to the effects of climate change. The platform translates climate research into actionable insights, enabling

agricultural communities to anticipate yield risks and implement targeted interventions for stronger climate resilience.

Developed in partnership with the Alliance of Bioversity International and the Foundation for Food and Agriculture Research (FFAR), which contributed \$1 million,

the updated platform marks a significant step towards open collaboration in climate adaptation. Two new partners, Bonsucro, a non-profit focused on the sugarcane industry, and Olam Agri, a global food, feed, and fibre business, have joined the initiative, contributing both data and funding to enhance the tool's reach and utility.

The CRP now covers additional geographies and crops, including cotton and rice, reflecting PepsiCo's intent to make the platform relevant to diverse agricultural systems. Upgrades also include improved data accuracy, relevance, and user accessibility across regions.

PepsiCo has tied this open source effort to its broader regenerative agriculture goals, increasing its target to 10 million acres by 2030, up from seven million previously. The company aims to drive the adoption of regenerative, restorative, and protective practices across its global supply chain.

"By helping translate science into actionable insights, we aim to empower stakeholders across the food and agriculture system to make informed decisions, strengthen supply chains and accelerate the shift to regenerative agriculture," said Margaret Henry, vice president for sustainable and regenerative agriculture, PepsiCo.

GitHub unveils Agent HQ to help developers manage multiple AI coding agents in one interface

GitHub reaffirmed its open source DNA at Universe 2025 in San Francisco, unveiling Agent HQ, a new architecture that allows developers to manage multiple
