

security vulnerabilities, click on the magic wand icon on the top left. We get the task wizard working as shown in Figure 3. Then we can enter the IP address in the text box. In this demo, I tested for vulnerabilities with two IP addresses -- 172.17.0.1 and a vulnerable public IP address 45.33.32.156. Now click on the *Start scan* button.

Analysing scan results

After the scans are complete, the dashboard provides a high-level overview. The results are prioritised by severity (e.g., High, Medium, Low), allowing you to focus on the most critical issues first. As seen in Figure 4, the scan on the public IP address revealed several medium and low-

severity vulnerabilities. Let's drill down into the specifics to understand their potential impact.

A sample task detail for the IP address 45.33.32.156 is shown in Figure 5. This detail can be obtained by clicking on the name of the task. The most important result is that the scan identified 19 potential security findings,
