

unusual authentication patterns.

SSH weak encryption algorithms supported:

- Disable weak encryption algorithms in SSH configurations and only allow the use of strong, modern encryption algorithms.
- Regularly update SSH server software to ensure it supports the latest encryption standards and security patches.
- Utilise tools and services that automatically audit SSH configurations for compliance with security best practices.
- Implement multi-factor authentication (MFA) for SSH access to add an extra layer of security beyond password-based authentication.

Best practices for organisations

To build an effective vulnerability

management programme, an organisation must establish formal policies with clear responsibilities, supported by a continuously updated inventory of all IT assets classified by their importance. This framework should guide a cycle of regular, automated vulnerability scans, with a structured remediation process that assigns clear ownership and timelines. Patching and remediation efforts must be prioritised to focus on the vulnerabilities that pose the greatest risk and impact critical systems. This entire technical process should be reinforced by providing ongoing security training to all employees, fostering collaboration between stakeholders and having a well-tested incident response plan ready. Finally, the programme's effectiveness must be continuously monitored and evaluated to drive constant improvement.

Overall, a proactive approach to security that includes regular updates, strong access controls, encryption, and

monitoring is essential to effectively mitigate these vulnerabilities and reduce the risk of exploitation. Vulnerability analysis plays a crucial role in maintaining the security posture of an organisation's IT infrastructure by identifying and addressing weaknesses that could be exploited by malicious actors.

The importance of vulnerability analysis is multifaceted: it helps prevent costly data breaches, thereby saving money and protecting the company's reputation, while also ensuring compliance with legal and regulatory requirements. By treating it as a continuous process rather than a one-time check, organisations can constantly improve their defences, building a resilient security posture that defends against ever-evolving cyber threats. **END**

Job Guaranteed.

You don't need a training institute. Just do it yourself.

WORK WITH OPEN SOURCE.

www.opensourceforu.com

Demand for Open Source is sky rocketing. Be it for managing IT infrastructure or development of software —Open Source experts are what organisations are seeking. Develop expertise in an Open Source stack, and watch your career graph zoom.

You don't need a training institute for this. You can do it yourself. And, *Open Source For You* can be your friend and a guide through this journey.
