

Mandiant's AuraInspector enhances Salesforce security

Google-owned cybersecurity firm Mandiant has released AuraInspector, a free, open source command-line tool designed to identify dangerous access control misconfigurations in Salesforce environments, marking a significant move to democratise enterprise-grade security testing.

AuraInspector focuses on preventing large-scale data exposure, targeting flaws that have been abused to leak credentials, health information, and identity documents at dozens of high-profile organisations over the past two years. The tool scans Salesforce Aura framework implementations from an external perspective, simulating what unauthenticated guest users could access without credentials.

According to Mandiant, its Offensive Security Services unit frequently encounters misconfigurations within Salesforce Experience Cloud, where complex permission models can allow excessive access to go unnoticed until after a breach.

AuraInspector automates detection by discovering Aura endpoints, listing accessible Salesforce objects, and testing whether guest users have excessive permissions to sensitive records.

Mandiant revealed that it used the Salesforce GraphQL API to bypass the platform's standard 2,000-record retrieval limit, describing this as a previously undisclosed technique. Efficiency is improved through action bulking, which tests multiple configurations in a single request.

Released on GitHub, AuraInspector is not an officially supported Google product. To prevent misuse, the open source release deliberately excludes data extraction features, operates in read-only mode, and does not modify target systems.

While fixes for vulnerabilities will continue to be provided across tiers, only DHI Enterprise customers receive a guaranteed seven-day CVE patching SLA.

Red Hat enables digital sovereignty in Europe

Red Hat has introduced Red Hat Confirmed Sovereign Support for all 27 European Union member states, positioning open source as the foundational enabler of true digital sovereignty in Europe.

The new offering is designed to address Europe's growing demand for verifiable local control over critical IT operations, data, technology and software support, at a time when European organisations are prioritising sovereignty to

safeguard data, reduce geopolitical risk, meet regulatory requirements, and strengthen cloud resilience and AI innovation.

What differentiates the initiative is its EU-citizen-driven technical support model, delivered entirely within the European Union for Red Hat software subscriptions. Support

services are provided exclusively by verified EU citizens, with EU-based teams overseeing end-to-end operations to reinforce compliance, jurisdictional security and operational autonomy. The service also provides 24/7 in-region availability, supporting business continuity and sovereignty mandates.

The offering builds on more than a decade of Red Hat's experience delivering specialised support models for regulated and compliance-driven environments, extending capabilities already trusted by over 20,000 organisations globally using Red Hat's open hybrid cloud portfolio.

Red Hat further strengthens the model through an ecosystem of more than 500 EU cloud partners, many offering sovereign cloud services, helping reduce reliance on non-EU hyperscalers while aligning with regional economic and regulatory priorities.

Red Hat Confirmed Sovereign Support is expected to be available in early 2026.

NVIDIA buys SchedMD, keeps Slurm open source and vendor neutral

NVIDIA has acquired AI software company SchedMD, signalling a deeper

commitment to open source technologies as competition intensifies across the artificial intelligence ecosystem.

SchedMD is best known as the creator of Slurm, a widely deployed open source workload manager that underpins high-performance computing systems and large-scale AI deployments worldwide. NVIDIA has

explicitly stated that Slurm will remain open source and vendor-neutral following the acquisition, ensuring continued support for heterogeneous environments that combine hardware from multiple vendors.
