

favour one group over another. For example, AI used for hiring should not prefer one gender or community.

Transparency: We must understand how AI arrives at critical decisions. The core function of explainability tools like SHAP and LIME is to explain why a model made a particular choice. They use model cards and training summaries to show the entire workflow by which the AI derived its result.

Privacy: Users should be aware of the personal data being collected by AI and how it's being used. Informed consent and the right to delete any data they are uncomfortable sharing is crucial.

Accountability: Every AI system should have a structured reporting and grievance-resolution process with a clearly accountable team or individual. Users should be able to report issues and have them fixed.

Safety: AI must operate reliably even when conditions change. Systems should be tested to handle unexpected situations or manipulations. For example, a chatbot should not provide incorrect advice if someone attempts to confuse it intentionally. Failure analysis and real-world testing help make AI dependable.

Security: AI must be protected against cyberattacks. Strong measures should be put in place to prevent misuse and data poisoning.

Accessibility: Disabilities and/or inadequate technical knowledge should not prevent any user from accessing and safely using AI. A simple interface and an inclusive user experience can be effective.

Sustainability: Every AI operation should adopt sustainable practices to remain energy efficient. These can include algorithm optimisation and the establishment of eco-friendly data centres.

Collaboration: Cross-functional teams can help implement the principles outlined above more effectively.

How mandatory compliance is evolving with regulatory pressures

Regulation has finally caught up with technological scale. Industry research indicates that more than 99 per cent of global companies now implement at least one responsible AI practice.

Gartner predicts that by 2026, more than half of all organisations will have operationalised responsible AI into their systems.

At the forefront is the EU AI Act, which classifies systems into:

- Banned
- High-risk
- Limited-risk
- Minimal-risk

DIY KIT: NFC, RFID, IoT & Embedded Systems

Want to learn and master NFC and RFID technology along with an IoT-enabled embedded system?

This kit includes all the essentials to start learning or building RFID/NFC projects.

POWERED BY

IndusBoard
COIN

Super small sized development board that enables you to create solutions for many use-cases where small size is super important.

SPECIAL INTRO PRICE

₹1,999 (Inclusive of GST)
