

## Arduino under criticism for its new terms of service

Arduino is under pressure from the maker and open source community after introducing controversial updates to its Terms of Service (ToS) and privacy policy, just one month after Qualcomm announced that it is acquiring the company. Makers argue that the new rules threaten Arduino's open source DNA and future hackability.

The most disputed change is a new clause stating that users cannot "translate, decompile or reverse-engineer the Platform, or engage in any other activity designed to identify the algorithms and logic of the Platform's operation, unless expressly allowed by Arduino or by applicable license agreements ...".

Arduino responded through a blog post insisting that the restrictions apply only to Software-as-a-Service cloud products, not to the Arduino IDE, open hardware designs, or other tools released under open source licences. "Anything that was open, stays open," it said. Both Arduino and Qualcomm declined further comment.

However, Adafruit's leadership remains concerned. Founder and engineer Limor Fried and managing editor Phillip Torrone said in a shared statement: "Why is reverse engineering prohibited at all for a company built on openly hackable systems?" They also questioned "what data from these AI systems is retained, who has access, and why is this collection opt-out only by not using the features."

Another change blocks users from identifying or supporting patent infringement claims against Arduino or its affiliates. While Arduino stresses its open source commitments, including keeping the Arduino IDE under AGPL-3.0 on GitHub, many fear a shift away from the freedoms that built its community.

toolchain to provide these packages to their users. This is a rewarding collaboration driving mutual success while also enabling us to extend our foundational

environments, broadening functionality, customisation options, and support for modern workloads across cloud native architectures.

SUSE's role spans secure package delivery, repackaging, and ongoing hardening, enabling developers to focus on innovation instead of maintaining and securing software dependencies.

commitment to security, reliability, and quality to a broader community of users."

Amazon Linux 2023 (AL2023) now gains immediate access to SUSE-vetted packages built on the Extra Packages for Enterprise Linux (EPEL) repository. The components are tailored for enterprise

## Raspberry Pi launches its lowest-priced Pi 5 variant

The Raspberry Pi Foundation has expanded the Pi 5 lineup with a new 1GB RAM variant priced at US\$ 45, making it the lowest-priced member of the flagship board family. This newcomer joins the existing 2GB, 4GB, 8GB and 16GB Pi 5 SBCs that share the same core hardware: a quad-core 2.4GHz Arm Cortex-A76 CPU (with cryptography extensions), dual-band Wi-Fi, a PCIe port for expansion, dual 4Kp60 HDMI outputs with HDR support, and a VideoCore VII GPU offering OpenGL ES 3.1a and Vulkan 1.3 graphics.

The 1GB variant brings the Pi 5's capabilities within reach of price-conscious developers, hobbyists and educational users. But the launch comes against a challenging backdrop. To counter rising LPDDR4 memory costs driven in part by increased demand from AI infrastructure, the Raspberry Pi Foundation has raised prices across most of its Raspberry Pi 4 and 5 lineups.

For instance, the Pi 5's 2GB, 4GB, 8GB and 16GB versions now cost US \$55, \$70, \$95 and \$145 respectively. Similar increases hit some Pi 4 models. According to the Foundation, the hikes are a temporary measure intended to ensure continuity of memory supply in a constrained market. The decision underscores the pressure on hardware makers from global DRAM shortages and surging demand, especially in AI-driven sectors.

## Shopify open sources Tangle to cut ML redundancy

Shopify has open sourced Tangle, its internal machine-learning experimentation platform designed to reduce repetition, enforce reproducibility, and accelerate

development cycles. The platform originated from challenges faced by Shopify's search and discovery teams, which work with millions of products and billions of queries.

Before Tangle, engineers often rebuilt identical datasets, reran long preprocessing steps, and struggled to reproduce historical results.

According to Shopify, "Machine learning development shouldn't work this way, but it does. 80% of development time is spent on data engineering, not algorithms."

The platform has already saved more than a year of compute time internally. "The CPU time savings alone are ridiculous," said Mikhail Parakhin, CTO of Shopify. A 10-hour pipeline can now complete in just 20 minutes when only one component changes.

Tangle features a visual pipeline interface backed by content-based caching. Pipelines are built as directed acyclic graphs composed of components, which are language-agnostic units that wrap arbitrary CLI programs. The platform is
