

OpenCloud 4.0.0 now available

OpenCloud 4.0.0 is now officially available under free open source licences, with optional commercial enterprise licences providing additional features and 24/7 support. The latest release brings multi-tenancy, allowing multiple tenants to operate independently within a single deployment. “This is specifically aimed at providers, municipal data centres, and large organisations with multiple departments or customer environments,” said Tobias Baader, product manager at OpenCloud.

The release also focuses on Kubernetes optimisation. New Helm charts are designed to achieve a 5.25-fold increase in efficiency, offering high availability, intelligent load balancing, and automatic scaling to minimise resource usage and reduce costs in large-scale deployments.

OpenSearch integration enhances the file search experience, providing scalable, high-performance searches even for extensive datasets. The desktop client now features Files on Demand, displaying all files locally while only downloading them when accessed, reducing storage requirements. Frequently used files can remain offline permanently, while rarely accessed content is offloaded.

Community and private users benefit from a new CalDAV/CardDAV-based calendar and contacts system via the Radicale server. Personal CalDAV URLs allow seamless integration with apps like Apple Calendar or Thunderbird.

OpenCloud emerged from ownCloud Infinite Scale (oCIS) in 2025 and is now managed by the Heinlein Group.

Nvidia and Mistral AI join forces to boost development of open source LLMs

Nvidia and Mistral AI have formalised a strategic partnership aimed at accelerating the development and optimisation of open source language models. The collaboration signals a major push to elevate open source AI by integrating Mistral’s

next-generation models deeply into Nvidia’s hardware and software ecosystem.

The partnership builds on earlier joint work, most notably the Mistral NeMo 12B model designed for chatbot and coding applications. The new

phase of collaboration centres on deploying and optimising the open source Mistral 3 model family, which introduces multimodal and multilingual capabilities. These models are engineered for flexible deployment, spanning cloud servers to edge devices, including RTX-powered PCs and Nvidia Jetson platforms.

As part of the agreement, Nvidia will integrate Mistral models into its AI inference toolkit to deliver significant performance improvements. This optimisation effort will be powered by TensorRT-LLM, SGLang, and vLLM, alongside the NeMo framework that supports enterprise-grade customisation.

Proxmox unveils open source Datacenter Manager

Proxmox has officially launched the first full and stable version of its Datacenter Manager, positioning itself as a robust open source alternative for private cloud

deployments. The product offers centralised management across multiple independent Proxmox environments, providing an aggregated view of all connected nodes and clusters.

Designed to handle complex and distributed

infrastructures, from local setups to globally scaled data centres, Datacenter Manager allows migration of virtual machines (VMs) across clusters without manual network reconfiguration, a feature long associated with VMware’s private cloud offerings.

The platform also includes VM fleet management tools to identify VMs requiring patches, lifecycle management for streamlined provisioning and updates, and a dashboard offering a comprehensive view of all hosts, workloads, and their status.

Proxmox’s Virtual Environment continues to host virtual machines and containers with software-defined storage and networking, gaining popularity among organisations that do not require full enterprise-level VMware features.

Developed by Proxmox Server Solutions GmbH under the GNU AGPLv3 open source licence, Datacenter Manager is written in Rust, based on Debian Trixie 13.2 with Linux kernel 6.17 and ZFS 2.3.4 support.

Anthropic acquires Bun and will keep it open source under the MIT licence

Anthropic has made a rare move in the AI industry by acquiring Bun while pledging
