

to keep the high-performance JavaScript runtime fully open source under the MIT licence. The decision ensures that the global developer community continues to access, contribute to, and innovate with one of the fastest runtimes available, preserving transparency, preventing lock-in, and strengthening Bun's open development model.

The acquisition positions Bun as core infrastructure for Anthropic's AI-powered coding ecosystem, forming the foundation for tools such as Claude Code, the Claude Agent SDK, and emerging autonomous developer agents. By keeping Bun open, Anthropic is building an open foundation for next-generation AI tools rather than enclosing a strategically valuable runtime.

Bun's integration is expected to significantly enhance the efficiency, scalability, and reliability of Anthropic's AI-driven coding workflows. Predictable performance and broad JavaScript compatibility make Bun particularly suited to autonomous agents that write, test, and deploy code.

Eclipse Foundation releases two open protocols for sovereign global dataspace

The Eclipse Dataspace Working Group (EDWG) has unveiled two open protocols, the Eclipse Dataspace Protocol (EDP) and Eclipse Dataspace Decentralised Claims Protocol (EDCCP), designed to enable open, interoperable, and sovereign dataspace worldwide. Both protocols are being submitted for international standardisation via the ISO/IEC JTC1 Publicly Available Specification (PAS) process.

The Eclipse Dataspace Protocol defines secure data sharing between entities using modern web technologies and usage control, while the Decentralised Claims Protocol provides trust and credential verification without third-party reliance. Together, they form a unified stack for secure and interoperable data exchange. EDWG will expand this stack in 2026 with additional specifications supporting Dataspace Trust frameworks.

"Open source is at the heart of digital sovereignty. By aligning open standards with community-driven innovation, we give organisations the ability to retain control over their data and infrastructure," said Mike Milinkovich, executive director, Eclipse Foundation.

The protocols facilitate interoperability between sovereign dataspace and allow organisations, industries, and nations to share data securely while retaining control.

Oligo Cyber Security exposes critical vulnerabilities in Fluent Bit

Oligo Cyber Security Ltd has discovered a chain of five critical vulnerabilities in the open source logging agent Fluent Bit, exposing cloud environments worldwide

to the risk of full remote compromise. Fluent Bit, used more than 15 billion times across cloud platforms, Kubernetes clusters, enterprise services and artificial intelligence environments, sits directly on ingestion pipelines, handling untrusted data from containers, files and network endpoints.

Anthropic, OpenAI, and Block support Linux Foundation's Agentic AI Foundation

The Linux Foundation has launched the Agentic AI Foundation (AAIF), a new open source organisation designed to house the critical technologies that allow AI agents to connect to tools, data, and each other. In a rare moment of alignment, competing AI companies Anthropic, OpenAI, and Block have moved their core agent-related projects into the foundation's neutral governance model.

Anthropic has contributed the Model Context Protocol (MCP), OpenAI has donated AGENTS.md, and Block has added its agent framework, Goose. These contributions shift foundational agentic AI infrastructure from proprietary control into a community-owned standard.

The membership structure underscores the scale of support behind AAIF. Platinum members include Amazon, Google, Microsoft, Bloomberg, and Cloudflare, while Gold members include Cisco, IBM, Oracle, SAP, and Snowflake. Platinum members receive seats on the AAIF Governing Board, giving Amazon, Anthropic, Block, Bloomberg, Cloudflare, Google, Microsoft, and OpenAI direct oversight.

MCP provides a universal protocol for connecting AI systems to external tools and has seen rapid adoption since its November 2024 release, with over 10,000 MCP servers now deployed. Goose offers a local agent framework capable of writing code, running tests, and managing workflows, while AGENTS.md standardises project-specific guidance for coding agents and is already used across more than 60,000 open source projects.
