

Nokia joins SONiC to power the next wave of open networking

Nokia has formally joined the Software for Open Networking in the Cloud (SONiC) Foundation as a Premier member, a move that cements the company's full-scale commitment to open source networking. The decision places Nokia directly within SONiC governance, with Mirza Arifovic, Nokia R&D lead, taking a seat on the SONiC Governing Board. Industry watchers consider the step as Nokia "finally going all-in" on SONiC after years of consistent contributions.

Since 2019, Nokia has supported the open source NOS with extensive engineering investments. These include data centre switching support, integration of SONiC NOS with Nokia's Event-Driven Automation platform running on SR Linux NOS, and contributions such as chassis and multi-ASIC architecture designs, advancements in the Switch Abstraction Interface (SAI), enablement of ARM-based architectures, and optimisations for small-footprint deployments.

Rudy Hoebeke, VP, software product management, Nokia IP networks business division, said the membership would "accelerate open source collaboration" and help Nokia's technology power "the next generation of cloud and AI infrastructure."

Nokia joins a strong roster of SONiC Premier members, including Alibaba, Arista Networks, Broadcom, Cisco, Dell Technologies, Google, Intel, Marvell, Nvidia, and Microsoft, which originally developed the NOS for Azure. The ecosystem continues to expand, with Juniper Networks recently joining and HPE launching an AMD Helios-based AI rack-scale system built using SONiC open standards.

The flaws enable attackers to bypass authentication, perform path traversal, overwrite files, hijack routing logic and trigger stack buffer overflows. The most severe issue, CVE-2025-12972, allows unsanitised tags to generate output filenames that can be manipulated using "../" sequences, enabling arbitrary file write and potential remote code execution. Additional pathways include forging tags by guessing a single character, injecting escape characters into downstream logs and exploiting long Docker container names to crash the agent or run code.

Some of the affected code has been present for more than eight years, raising significant concerns about invisible weaknesses in critical open source infrastructure. The disclosure was coordinated with Amazon Web Services Inc., which has secured its internal systems and released Fluent Bit version 4.1.1 while urging customers to update immediately. AWS also recommends Amazon Inspector, AWS Security Hub and AWS Systems Manager to detect and fix exposure.

Oligo highlighted systemic weaknesses in open source security: "Despite multiple responsible disclosure attempts through official channels, it took more than a week and the involvement of a major cloud provider before the vulnerabilities received sustained attention and remediation."

Linux Foundation lauds Japan's OSS boom but warns of governance and security gaps

Linux Foundation Research has released its latest report, 'The State of Open Source Japan 2025: Accelerating Business Value through Strategic Open Source

Engagement'. The findings show Japan entering a decisive phase where open source is now a strategic business infrastructure, with 69% of organisations reporting increased OSS-driven value, surpassing the global 54% rate.

Noriaki Fukuyasu, VP of Japan operations at the Linux Foundation, noted: "A major

takeaway from the 2025 report is that open source in Japan has reached a pivotal turning point, evolving from a mere option to a strategic imperative that underpins competitiveness and innovation. The fact that 69% of organisations experienced increased business value from OSS over the past year is a testament to the tireless efforts of Japan's leaders and communities, and I am truly proud of this meaningful progress." He added: "Moving forward, it is essential to establish formal governance structures and shift from passive use to active ecosystem participation in order to strategically bridge this gap."

The report highlights governance and security maturity gaps, with only 41% of organisations having OSPOs (Open Source Program Offices), 39% maintaining clear open source strategies, and just 26% checking community activity when evaluating components. Despite these gaps, Japan excels in AR/VR, 3D simulation, blockchain, and manufacturing technologies.

Demand for enterprise-grade support continues to rise, with 89% expecting sub-12-hour responses and 45% requiring long-term support guarantees. Barriers persist, including IP concerns (52%) and the absence of clear policies (51%). The report argues that deeper ecosystem participation, unified security frameworks, and formal governance structures will be essential to unlock Japan's next wave of open source competitiveness.
