

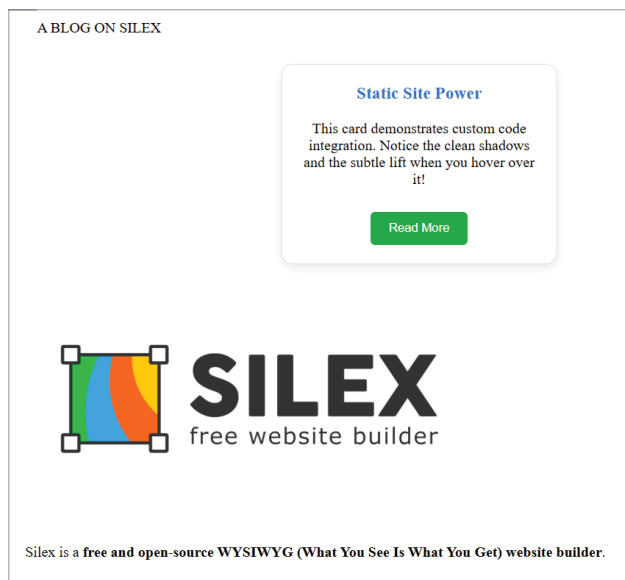

Figure 6: Final blog page

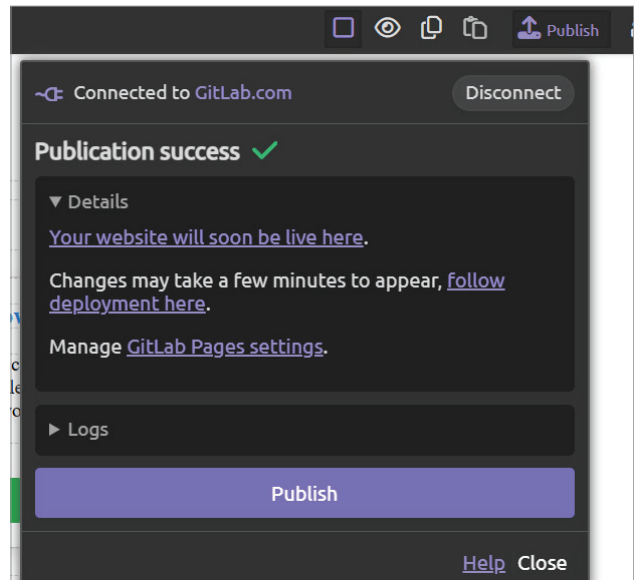

Figure 8: Publishing is successful

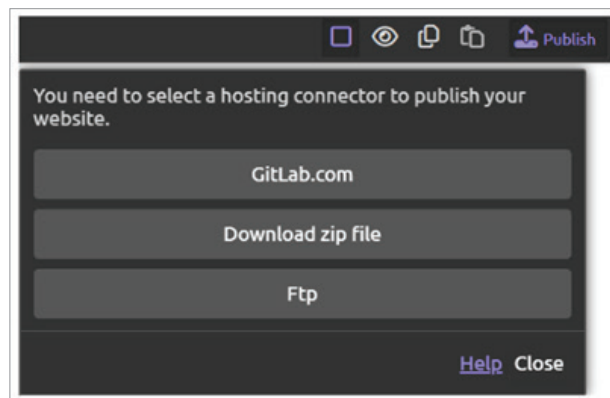

Figure 7: The process of publishing

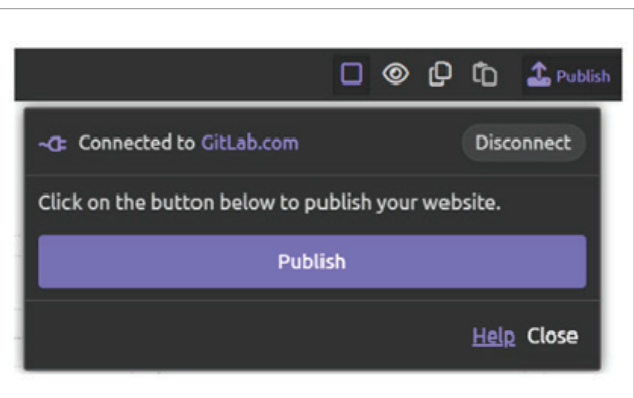

(desktop, tablet, mobile). When you click on the *Phone* icon, the canvas simulates a narrow screen. Once in the mobile view, you can make highly specific adjustments. If a heading looks too large, select it and reduce its font size in the *Property Panel*. Silex automatically applies this adjustment only to the mobile breakpoint, leaving the desktop version untouched. You can also easily adjust elements to stack vertically or even hide large, desktop-only graphics entirely from the phone view.

Publishing the final static code

Now, after our site is complete, let us click on the *Publish* icon on the top navbar, select *Gitlab.com*, and click on *Publish* as shown in Figure 7.

After the process is successful, you will get the live website link as shown in Figure 8.

Now, the process of publishing the website is complete.

You can click on the link *Your website will soon be live here* to access the live website.

Silex is a powerful choice for static web design because it guarantees 100% open source freedom and data ownership, freeing users from vendor lock-in while providing fast, clean HTML/CSS output. While excelling at static sites, Silex's clean output makes it an ideal front-end for future dynamic expansion; users can easily connect their Silex-designed pages to an open source headless commerce engine like Saleor or Medusa to build a complete e-commerce solution, thus preserving the open source ethos across both design and backend logic. **END** 🐧
