

# FOCUS

## Docker

### Building Scalable Microservices with Docker

Discover how microservices and Docker, the two pillars of modern software development, work together to build strong and scalable software architectures.

### Things to Know About Microservices and Containerisation

Here's a quick look at how microservices and containerisation work, with a few best practices thrown in.

[Read more on page.....43](#)

### Serverless Containers: Exploring Emerging Trends

Over the years, virtual machines and traditional containers have made way for serverless computing and serverless containers. Here's a quick look at the major platforms offering serverless containers, the benefits and trade-offs of this technology, and where it's headed.

[Read more on page.....47](#)

### Containers and Virtual Machines: What's the Difference?

Here's an explanation of what containers and virtual machines are, how they work and compare, and when to use each technology in modern software deployment.

[Read more on page.....64](#)

### Kubernetes: Architecting Agility in the Enterprise

At its core, Kubernetes offers a powerful abstraction layer that simplifies the deployment and management of containerised applications. Enterprises cannot afford to ignore the scalability, security and cost-effectiveness it offers.

### A Complete Guide to Deploying Java Applications in Docker

Explore the entire life cycle of deploying Java applications via Docker — from understanding the basics and writing the initial Dockerfile to building container images and managing complex multi-container deployments using Docker

Compose. You can use this guide to streamline the deployment pipeline of a Spring Boot microservice, a traditional Java SE program, and even an enterprise web application. [Read more on page.....51](#)
