

innovation. Red Hat OpenShift AI is an ideal platform to run these workloads delivered by NVIDIA Enterprise AI Factory validated designs, offering the scale, flexibility and power necessary to deliver product-ready generative AI across the hybrid cloud.”

Red Hat will support NVIDIA’s Blackwell architecture across its AI solutions and hybrid cloud infrastructure. A fully validated, performance-tested reference architecture for the NVIDIA Enterprise AI Factory has been built using Red Hat OpenShift AI—demonstrating its readiness to support the growing demand for scalable AI agent frameworks. The platform offers organisations a consistent environment for deploying and managing AI agents using vLLM-based inference, along with enhanced observability and monitoring tools.

With Red Hat OpenShift AI and NVIDIA NIM microservices available via the application catalogue, organisations can easily construct a complete, validated AI software stack to run on-premises AI factories using NVIDIA RTX PRO servers and Blackwell B200 systems.

Red Hat’s enterprise AI strategy is grounded in open source innovation, hybrid cloud flexibility, and a robust partner ecosystem. By collaborating across the AI landscape—from hardware manufacturers to systems integrators—Red Hat enables businesses to build tailored AI solutions that align with their specific needs.

Red Hat and AMD partner to advance open source support for AI workloads

Red Hat and AMD have announced an expanded partnership to enhance open source support for AI workloads, focusing on the optimisation of AMD Instinct accelerators within the Red Hat AI ecosystem.

Building on their joint efforts in the new llm-d open source project for generative AI, the collaboration now extends to performance tuning, multi-GPU scaling, and ecosystem integration for open source AI inference, particularly around the vLLM project.

Key highlights of the collaboration include enhanced performance on AMD GPUs, improved multi-GPU support and expanded engagement with the vLLM ecosystem. Additionally, AMD Instinct GPUs are now fully enabled on Red Hat OpenShift AI and supported on Red Hat Enterprise Linux AI. Red Hat will also add support for AMD Instinct on the Red Hat AI Inference Server, further broadening deployment options for customers.

This collaboration underscores the commitment of both companies to open innovation and optimised AI infrastructure, delivering scalable, high-performance solutions for the enterprise AI landscape.

SiFive and Red Hat collaborate to build a high-performance RISC-V environment

SiFive, a leader in RISC-V computing, has partnered with Red Hat to introduce a developer preview of Red Hat Enterprise Linux (RHEL) 10 on the SiFive HiFive Premier P550 platform. This collaboration provides developers with a high-performance RISC-V environment to build and optimise the next generation of enterprise and cloud computing applications.

The HiFive Premier P550 offers a robust RISC-V CPU development platform, now enhanced by support for Red Hat Enterprise Linux 10, the latest version of the leading enterprise Linux distribution. This integration enables developers to build, test, and deploy applications tailored to the growing demand for flexible, scalable, and efficient infrastructure—especially relevant in AI and cloud data centre environments.

Both Red Hat and SiFive are founding members of the RISC-V Software Ecosystem (RISE) Project, which is focused on optimising open source software for deployment across RISC-V systems.

SiFive’s high-performance RISC-V technology is already being leveraged by major organisations to power compute-intensive workloads, including AI and machine learning tasks, within modern data centres. With the addition of RHEL 10 support, the collaboration sets the stage for broader adoption of open source solutions across the RISC-V ecosystem.

“Empowering the software developer community is an important part of realizing our vision to enable our partners to deliver systems with a meaningfully lower total cost of ownership than incumbent platforms,” said Ian Ferguson, VP, Vertical Markets at SiFive. “Delivering Red Hat Enterprise Linux 10 developer preview on the popular SiFive HiFive Premier P550 provides a strong foundation to inspire the next generation of enterprise workloads and AI applications optimized for RISC-V.”
