

Many companies, including those manufacturing routers, VPNs, or enterprise applications such as digital banking software, depend on our services to keep their open source stacks secure and up-to-date.

Q. Which industries are your key focus areas?

A. Any industry with governance boundaries or sensitive data is a key focus for us. These include the healthcare, cloud services, BFSI (banking, financial services, and insurance), government and regulatory-driven industries, and the embedded systems industry. Embedded systems are a prime market for us because they handle sensitive data and require extensive efforts to upgrade or fix open source components. The process is complex due to dependencies across appliances, operating system kernels, third-party libraries, open source components, and proprietary products, creating an intricate lineage.

Q. How do you see the Indian market evolving in this space?

A. Historically, India has been more of a development hub, serving as an IT or engineering arm for global companies building products, but that is changing. The Indian government has introduced guidelines similar to those in the United States. One key regulation is SBOM, which mandates that companies selling to the government of India must disclose the composition of their products while ensuring they meet security standards.

We have significant engagements with such companies in the field of cybersecurity. As a result, we are not just developing solutions in India—we are also selling them here to private entities providing services to the government agencies and financial institutions.

Q. How are you incentivising the open source developer community to expand?

A. Right now, we do not offer monetary incentives, as the focus is on recognition, engagement, and professional growth.

Our vision for this community is similar to how Expert Exchange operated in the past—it was a paid platform because people received timely help. Now, we are applying this model to open source issues. Whenever new open source challenges arise, they are posted to our developer group, and members use our platform to accelerate fixes. Multiple developers can submit solutions, and if a fix is accepted by the community, the contributor receives recognition and rewards. This includes star ratings, badges, and other incentives to encourage participation.

Our goal is to engage the Indian developer community, as this presents a huge opportunity for India, and bring Indian developers into the global open source security landscape. Given that 85% of third-party products rely on open source, India's contribution to securing this ecosystem is very critical. **END** 

An “AWESOME” Development Board from India?

- **Super Small:** 3 centimeters
- **Super Smart:** 3 processors
(Xtensa® Microprocessor + 2 ULP RISC-V Coprocessor)
- **Super Sensitive:** 5 Sensors
- **Super Connected:** Wifi & 10+ Interfaces
- **Super Flexible:** 30 GPIOs
- **Super Easy:** FPC + Dedicated Battery Connector
