

Microsoft introduces Edit, a lightweight command line text editor

Microsoft's newly announced command line (CLI) text editor, Edit, is an open source, minimalist tool designed specifically for developers who prefer working in the command line. Recognising the absence of a default CLI text editor in 64-bit versions of Windows, Microsoft has created Edit to fill that gap with simplicity and speed in mind.

Edit can be launched by simply typing `edit` or `edit <your-file-name>` in the command line, allowing users to make quick file edits without leaving the terminal. Despite its lightweight nature, the editor includes useful features like mouse support and multi-file editing, with file switching enabled via `Ctrl+P`.

You can find and replace text with `Ctrl+R` or select *Edit > Replace* in the TUI menu. There is Match Case and Regular Expression support as well. Edit supports word wrapping. To use Word Wrap, you can use `Alt+Z` or select *View > Word Wrap* on the TUI menu.

Initially, Edit will be available to members of the Windows Insider Program, with broader integration into the Windows 11 release builds planned in the future. Microsoft notes that Edit is still in its early stages, and the Insider rollout will occur gradually over the coming months.

For those eager to try it out ahead of the official release, Edit is available for download now on GitHub.

significantly enhanced dashboard designer, offering better layout controls, widget resizing options, improved responsiveness, and increased support for inter-widget communication. These updates allow users to design more dynamic and interactive dashboards with ease.

A standout feature in this release is the advanced parameterization within the dashboarding environment. Users can now create custom filters and apply them across multiple reports more efficiently, streamlining the user experience. The report designers also benefit from an improved UI and faster performance, with better error handling and more control over SQL queries.

Developers will appreciate the upgraded JavaScript API, which offers more granular control over dashboard elements and events. This enables deeper customisation and integration with external applications or services. In terms of security, Helical Insight 5.2.3 introduces tighter control over role-based access and data-level restrictions, aligning with enterprise-grade governance standards.

Performance has also seen notable improvements, particularly in rendering large datasets and managing concurrent users. Backend optimisations, caching enhancements, and better memory management ensure smoother operation even under heavy loads. Helical Insight continues to provide support for a wide range of data sources, including traditional databases, Big Data platforms, and cloud-based services.

This release reaffirms Helical Insight's position as a flexible, cost-effective, and developer-friendly alternative in the BI space. With its open source nature and growing feature set, version 5.2.3 is set to attract both SMEs and large enterprises looking for scalable analytics solutions.

OWASP adopts BLADE Framework to combat business logic attacks

The Open Worldwide Application Security Project (OWASP) has officially adopted the Business Logic Attack Definition Framework (BLADE Framework) as a flagship project, renaming it the OWASP BLADE Framework Project. The update marks a significant milestone, recognising the framework as an industry standard in the battle against sophisticated, automated cyber threats.

Originally developed by cybersecurity firm Netacea in 2022, BLADE is an open source initiative modelled after the MITRE ATT&CK framework. It helps enterprises understand and defend against business logic abuse using a structured matrix of tactics, techniques, and phases (TTPs). "The OWASP Foundation is proud to welcome the BLADE Framework as an official project," said Starr Brown, director of Open Source Programs and Projects at OWASP. "Its rigorous research and practical insights offer a major leap forward in combating business logic abuse globally."
