

- **JavaScript errors:** Captures and categorises errors affecting the user experience.
- **User interactions:** Tracks clicks, navigation, and engagement patterns.
- **Frontend performance:** Monitors bottlenecks affecting responsiveness.

This data is visualised in the New Relic dashboard, enabling frontend teams to optimise performance, debug errors faster, and enhance the overall user experience.

## Infrastructure monitoring

Infrastructure monitoring is essential for tracking resource usage and performance across all containers in the system, including frontend, backend, and model services. New Relic's infrastructure monitoring provides real-time insights into host-level metrics such as CPU usage, memory consumption, disk I/O, and network activity, along with container-specific metrics like per-container CPU and memory utilisation, uptime, and restart counts. This comprehensive monitoring ensures stability and efficiency across all deployed services. Here are the steps to set up infrastructure monitoring with New Relic.

- Install the New Relic infrastructure agent using the following command:

```
curl -Ls https://download.newrelic.com/infrastructure_agent/
```

```
gpg/newrelic-infra.gpg | sudo apt-key add -
```

- Add the New Relic Repository based on the appropriate Linux version:

```
echo "deb [arch=amd64] https://download.newrelic.com/infrastructure_agent/linux/apt jammy main" | sudo tee /etc/apt/sources.list.d/newrelic-infra.list
```

- Update the package list and install the agent:

```
sudo apt-get update; sudo apt-get install newrelic-infra -y
```

- Configure the infrastructure agent:

```
sudo nano /etc/newrelic-infra.yml
```

- Add the following configuration:

```
1. license_key: YOUR_LICENSE_KEY
```

```
2. enable_docker: true
```

- Restart the agent to apply the configuration:

```
sudo systemctl restart newrelic-infra
```
