

LY Corporation joins the Linux Foundation as Gold Member

The Linux Foundation, the non-profit organisation enabling innovation through open source, recently announced that LY Corporation has joined as a Gold Member. Formed in October 2023 through the merger of Z Holdings and its subsidiaries—including LINE Corporation and Yahoo! Japan—LY Corporation is now one of Japan's largest technology companies, offering services spanning search, e-commerce, communications, and advertising.

"We're thrilled to welcome LY Corporation as a Gold Member," said Jim Zemlin, executive director of The Linux Foundation. "Their extensive experience and commitment to innovation will be instrumental in supporting critical open source projects in Japan and beyond."

LY Corporation brings a long-standing history of open source contributions, dating back to its roots as Yahoo! JAPAN and LINE Corporation. The company has developed and maintained several open source tools, including Armeria, NGT, and Promgen. With its Gold Membership, LY Corporation aims to deepen its engagement with the open source community, contribute to strategic projects, and leverage the Linux Foundation's global ecosystem to further strengthen its initiatives.

"At LY Corporation, we believe open source is key to advancing technology and delivering life-enriching platforms that inspire WOW! moments for users around the world," said Masahiko Kokubo, head of technology management group and executive corporate officer, LY Corporation. "Joining the Linux Foundation as a Gold Member affirms our commitment to open, collaborative development."

LY Corporation joins a prestigious group of over 1,000 Linux Foundation members, including other Gold Members such as Baidu, Cisco, Dell Technologies, Google, Honda, Sony, and Toyota.

and rate limiting, offering greater flexibility and control compared to traditional ingress controllers.

"At Tigera, we're committed to empowering the open source community with tools to scale Kubernetes environments securely and efficiently," said Phil DiCorpo, senior director of product management at Tigera.

MongoDB Atlas now available in Malaysia and Thailand

MongoDB has announced that MongoDB Atlas, its multi-cloud data platform, is now available in Amazon Web Services (AWS) regions in Malaysia and Thailand. This expansion strengthens MongoDB's presence in Southeast Asia, a rapidly growing market where the company has seen a 200% increase in headcount over the past two years. The region has become a key contributor to MongoDB's Asia Pacific business, which has surpassed \$220 million in annual revenue.

MongoDB Atlas is already available in Australia, Hong Kong, India, Indonesia, Japan, Singapore, and South Korea. Businesses in Malaysia and Thailand—spanning financial services, telecommunications, healthcare, agritech, and manufacturing—can now leverage MongoDB Atlas on AWS for high availability, data sovereignty, and reduced latency.

"This launch marks a significant milestone in our regional growth," said Stewart Garrett, regional vice president, ASEAN and Japan, MongoDB. "By bringing MongoDB Atlas to Malaysia and Thailand, we're enabling businesses to gain real-time insights, enhance security, and scale seamlessly. Beyond performance improvements, this expansion supports digital transformation, fuels innovation, and contributes to economic growth in Southeast Asia."

Kirsten Gilbertson, partner organisation leader, ASEAN, AWS, added: "AWS is committed to empowering customers with leading technologies. The expansion of MongoDB Atlas into Malaysia and Thailand allows businesses to innovate faster, meet data residency requirements, and improve performance using our regional cloud infrastructure."

Thailand-based Botnoi, which provides AI-powered chatbots and voice bots, relies on MongoDB Atlas to manage and analyse large datasets. "With MongoDB Atlas on AWS, we can handle massive amounts of data efficiently, helping us deliver superior customer service solutions," said Dr Piyoros Tungthamthiti, CTO and co-founder of Botnoi.

OpenELA's Leapp open source project will enable seamless upgrades for Enterprise Linux systems

OpenELA has unveiled a new branch of the Leapp open source project designed to facilitate in-place upgrades for all Enterprise Linux (EL) variants. Leapp helps organisations transition their operating systems (OS) to newer versions of Enterprise Linux by offering actionable insights, identifying potential risks, generating checklists, and automating crucial upgrade steps.

The announcement comes as part of OpenELA's broader efforts to strengthen collaboration within the open source community, with Leapp now expanding its support to include various enhancements. Among the key updates are features that ensure kernel compatibility for enabled system features, improve detection of unsupported configurations, and provide comprehensive pre- and post-upgrade steps. Additionally, Leapp now includes mission-critical capabilities for enterprise users, including built-in support for SELinux, upgrades with FIPS mode enabled, enhanced support for network storage configurations, and the option to perform upgrades via kexec fast reboots, eliminating the need for full system reboots and hardware reinitialisation.

"We understand that upgrading critical systems in enterprise environments can be challenging," said Greg Marsden, senior vice president of Linux development at Oracle. "With this update, we are helping customers safely transition between major Linux
