

OS versions, while addressing risks posed by core system changes like SELinux and systemd. These capabilities, which were previously available only to Oracle Linux users, are now being made available to the broader OpenELA community.”

Brent Schroeder, head of the office of the CTO at SUSE, said: “For SUSE customers in compliance-driven sectors, migrating to newer versions of Linux is critical for business continuity. With Leapp, we can now offer seamless migrations that reduce downtime, ensure compliance, and help businesses avoid costly disruptions.”

Originally designed to support Red Hat Enterprise Linux (RHEL) systems, Leapp’s new features significantly broaden its applicability across all Enterprise Linux-compatible distributions.

SUSE expands its portfolio on Google Cloud Marketplace

SUSE has announced a significant expansion of its offerings on Google Cloud Marketplace, strengthening its commitment to delivering innovative, secure, and flexible solutions for cloud customers. The expanded portfolio includes the launch of SUSE Multi-Linux Support and the addition of SUSE LTSS (Long Term Service Pack Support) to the Google Cloud Marketplace, both now eligible for cloud committed spend. This move further enhances SUSE’s ability to support businesses with their digital transformation initiatives and cloud modernisation efforts.

The expansion also includes major advancements in key areas like AI, Kubernetes management, and security solutions. In addition to the core software offerings, SUSE is now making its SUSE Consulting, SUSE Premium Support, and SUSE Training Services available via Google Cloud Marketplace, providing customers with expert guidance, enhanced support, and comprehensive training to maximise the value of SUSE solutions on Google Cloud.

“SUSE’s collaboration with Google Cloud allows us to deliver a broader range of open source solutions, directly addressing key customer needs,” said Elodie Mallea, global alliance director Google Cloud at SUSE. “By expanding our portfolio with offerings like SUSE Multi-Linux Support and introducing innovations such as secure SUSE AI, we’re reinforcing our commitment to customer choice, security, and continuous innovation.”

According to a recent IDC report, by 2027, over 60% of businesses will have modernised up to half of their cloud architecture to drive infrastructure and cost efficiency while fostering innovation. SUSE’s extended partnership with Google Cloud plays a key role in supporting this transition, empowering businesses to unlock the full potential of their cloud environments and reduce operational costs.

Red Hat AI enhanced to expand its AI capabilities in a hybrid cloud

Red Hat, Inc., has announced new enhancements to Red Hat AI—its comprehensive suite of products and services aimed at accelerating the

development and deployment of AI solutions across hybrid cloud environments. Red Hat AI now offers a robust enterprise platform for model training and inference, delivering greater efficiency, a streamlined user experience, and the flexibility to deploy AI workloads anywhere within a hybrid cloud.

As organisations increasingly seek cost-effective ways to scale large language models (LLMs) for diverse use cases, they face the added complexity of integrating

CitrineOS 1.6.0 adds OCPP 1.6 support for EV charging compatibility

LF Energy, the open source foundation dedicated to accelerating the energy transition through collaborative software and hardware innovation, has announced the release of CitrineOS 1.6.0, now featuring full support for OCPP 1.6. As the premier open source Charging Station Management System (CSMS) software stack, CitrineOS’s latest update enhances interoperability and expands its reach to a wider array of electric vehicle (EV) chargers.

Originally developed by S44 Energy and contributed to LF Energy as an open source initiative, CitrineOS was designed with a modular architecture aligned with the latest OCPP 2.0.1 standard. With this release, the platform now offers seamless compatibility with OCPP 1.6, the most widely deployed protocol in the EV charging ecosystem, allowing for more flexible integration and streamlined communication across various charger types.

“Supporting OCPP 1.6 marks a major milestone in CitrineOS’s mission to offer a truly open and interoperable EV charging solution,” said Alex Thornton, executive director of LF Energy. “This update brings the benefits of vendor-neutral, community-driven software to a broader segment of the market, ultimately accelerating EV infrastructure deployment.”

S44 Energy, the original creator of CitrineOS, remains an active contributor in its evolution. “Our vision has always been to develop charging software that meets real-world infrastructure demands,” said Olga Haygood, CEO of S44 Energy. “With the addition of OCPP 1.6 support, we’re empowering more network operators to adopt open source solutions that reduce vendor lockin, improve reliability, and scale with ease.”
