

Feature	GPT4All	ChatGPT
Underlying model	Open source models (e.g., Llama, GPT-J)	GPT-3.5 or GPT-4 (OpenAI)
Accessibility	Can be run locally on personal devices	Primarily accessed through OpenAI's website or API
Cost	Free (depending on the model used)	Free tier available; paid 'Plus' subscription for GPT-4 access
Customisation	More customisable, allows for fine-tuning with specific datasets	Less customisable and limited to OpenAI's pre-trained models
Data privacy	Potentially more private as it can be run locally	Data may be stored and used by OpenAI
Internet access	Depends on the model; may require internet connection for some tasks	Can access and process information from the internet
Multimodal capabilities	Limited, primarily focused on text	GPT-4 has some multimodal capabilities (image and text), but not fully implemented in ChatGPT yet
Performance	Varies depending on the model; generally considered less powerful than GPT-4	GPT-4 is considered one of the most powerful language models available
Technical expertise	May require more technical knowledge to set up and use	User-friendly interface; easier to use for non-technical users
Community support	Growing community, but potentially less extensive than ChatGPT	Large and active community, with extensive resources and support
Updates and development	Dependent on the open source community; updates may vary	Actively developed by OpenAI, with regular updates and improvements

is safe in your local device, which improves privacy.

Cost: Since the LLMs are run locally, you do not need to pay to access any cloud-based servers that run LLMs based on usage. The local execution helps to cut costs.

Offline access: The local execution of LLMs allows you to access your data from your machines directly without an internet connection. This can be beneficial when internet connectivity is not available or is unreliable.

More control and customisation: Running the LLMs locally provides more control. There are also more possibilities to customise and modify the model. You can fine-tune it or integrate it with various software based on your requirements.

Getting started with GPT4All

You can set up GPT4All just the way you do so for any other application

on your device. The first step is to download and install the application; next, select the files you want to analyse, and lastly, you can ask questions as prompts.

Follow these steps to download and install GPT4All.

1. For installation, find the Windows, Mac, or Linux download files at <https://www.nomic.ai/gpt4all>.
2. Download a model. It's recommended to start with Llama3, but you can browse more models (https://docs.gpt4all.io/gpt4all_desktop/models.html#example-models).
3. Once downloaded, go to Chats.
4. Click on *Load Default Model* (will be Llama 3 or whichever model you downloaded).
5. Try the example chats or your own prompts.

For more details on installation, setting up things, cookbooks, FAQs, and

troubleshooting tips, you can refer to the GPT4All documentation at <https://docs.gpt4all.io/index.html>.

Use cases and applications of GPT4All

Developing new applications:

Developers can leverage the open source nature of GPT4All that fosters community-driven development. New applications or specialised tools can be developed using the existing code base.

Research and experimentation:

Researchers can study how LLMs work, check model biases, test new prompt techniques and strategies, etc, without bothering about cost or API usage limit.

Writing assistance: Unlike other AI tools like ChatGPT or Gemini, you can use GPT4All for a variety of writing tasks ranging from writing email content to creative writing such as poems or scripts without the need for internet access.
