

Qualcomm acquires Arduino

Qualcomm has acquired Arduino, the Italian not-for-profit firm renowned for its open source hardware and software used in building prototypes of robots and electronic gadgets. The deal gives Qualcomm access to one of the largest open source hardware communities in existence, with over 33 million developers worldwide.

San Diego-based Qualcomm, traditionally known for its smartphone chips, is accelerating its diversification strategy with this acquisition, moving deeper into connected vehicles, wireless earphones, laptops, and industrial machines. The integration of Arduino marks a decisive step towards bridging open source innovation with Qualcomm's proprietary processing power.

Crucially, Arduino will retain its independent brand, tools, and mission, ensuring continuity of its open source ethos even as it gains access to Qualcomm's industrial-grade hardware and global reach. Arduino's platforms are widely used by students in schools and universities to learn programming and electronics, as well as by engineers for rapid prototyping of devices.

Both companies affirmed that Arduino's hardware and software will remain compatible with chips from multiple providers, continuing its inclusive approach to open development.

As part of the deal, Qualcomm will launch a new Arduino development board powered by its 'Dragonwing' processor, designed for robots requiring high computational performance alongside real-time control. It will also debut 'AppLab', a new coding tool to help Arduino developers bridge the gap between robotics programming and artificial intelligence systems.

assignments, and assessments aligned with CO-PO attainment. Its advanced AI-powered LMS delivers adaptive learning content, video and quiz generation, timetable optimisation, and peer-review support.

The platform offers over 50 scalable modules, integrates with third-party APIs, and conforms to all four quadrants of LMS. Its accreditation management framework supports NAAC, NBA, NIRF, ABET, QS, and other standards, offering real-time audits, automated scoring, gap analysis, and actionable improvement roadmaps.

For students, the AI Mentor app provides curated MOOC content, reskilling pathways, competitive exam prep, and industry internships to enhance employability.

Adopting an open source model, Epaathsala provides a free base download with optional hosting and premium support, along with full knowledge transfer, installation assistance, and training.

Suman Nandy, founder and director, said: "Our goal was to move institutions from data management to intelligent decision-making." Sulagna Singha Roy, vice president, added: "Quality tools should not be limited by institutional wealth."

Already implemented in leading Indian institutions, Epaathsala plans to roll out its generative AI-based LMS internationally within the current financial year, demonstrating how open source innovation can democratise AI adoption in higher education.

Akamai and Apiiro unite to secure open source components across applications

Akamai Technologies and Apiiro have expanded their partnership to deliver a unified platform for application security posture management (ASPM), now with explicit coverage of open source components. The original partnership, launched in 2024, focused on providing visibility into APIs in source code.

The expanded collaboration integrates Akamai's application security platform with Apiiro's agentic ASPM platform, giving enterprises comprehensive security coverage throughout the software development lifecycle (SDLC). The combined platform offers full API inventory and discovery, visibility across any environment, posture management, and runtime protection through Akamai API Security and App & API Protector. Crucially, it also provides governance over open source components, misconfigurations, infrastructure as code (IaC), and web application firewalls (WAF).

Enterprises face pressing challenges, including faster development cycles driven by AI-assisted coding, fragmented security tools that operate in silos, governance gaps in policy enforcement and SBOM reporting, and rising API volumes due to
