

agentic AI expansion. The Akamai-Apiiro platform addresses these by connecting runtime and code-level insights, prioritising vulnerabilities with a business-aware backlog, and centralising application risk management.

Through this integrated solution, organisations gain enhanced visibility and control over open source components and third-party dependencies, ensuring better risk management, accelerated remediation, and unified governance. The partnership also provides joint customer support and aligned product roadmaps, making it easier for development and security teams to manage application risk at scale.

By explicitly covering open source components, the platform helps enterprises safeguard applications while maintaining the speed and agility required in modern development environments.

Europe gets its own open source alternative to Microsoft 365 — Nextcloud Workspace

Nextcloud, a German productivity and collaboration software vendor, has launched Nextcloud Workspace this month in partnership with data centre provider Ionos. The new platform positions itself as an open source, digitally sovereign alternative to Microsoft 365 (M365) and Google Workspace.

Designed to combine the ease of popular SaaS tools with full European data control, Workspace will be subscription-based and priced competitively with US cloud offerings. Nextcloud will deliver the software, patches, and updates, while Ionos manages servers and backups.

“Now, we basically have the best of both worlds: we have a super easy-to-use SaaS product, but it is completely European,” said Frank Karlitschek, CEO and co-founder of Nextcloud. He added that European customers are increasingly wary of relying on US cloud providers, citing risks tied to tariffs, political leverage, and uncertainty in transatlantic relations. “There was a huge wakeup call in Europe —

several, actually ... There’s a huge, huge amount of uncertainty in Europe [around] how reliable the US is.”

European organisations have grown more motivated to seek local alternatives, with IDC identifying

protection from extraterritorial data requests as the top driver. “When we’ve asked organisations, ‘Are you interested in implementing digital sovereignty solutions because of all the unrest you’ve seen in 2025?’ the answer is, ‘Yes, we are,’” said Rahiel Nasir, research director at IDC. He cautioned that the shift is gradual: “Despite all the hype, Europe is not abandoning the US providers in droves ... There’s a small shift away from them, not a huge shift.”

Founded in 2016, Nextcloud already offers Nextcloud Hub with tools for editing, email, meetings, and AI assistance. The firm reports a threefold increase in requests for its tools, underscoring Europe’s appetite for sovereign, open source alternatives.

Anthropic releases Claude Agent SDK alongside Claude Sonnet 4.5

Anthropic has unveiled Claude Sonnet 4.5, its most powerful code-focused AI model to date, alongside the launch of the Claude Agent SDK, an open source toolkit that allows developers to build autonomous agents powered by Claude’s architecture.

The Claude Agent SDK is now publicly available, enabling customisation of AI systems through long-term memory management, balancing autonomy with user control, and coordinating multiple sub-agents. This open move is set to expand developer access to advanced infrastructure typically locked within proprietary AI systems.

Claude Sonnet 4.5 brings major technical leaps. It can sustain complex, multi-step coding tasks for over 30 hours, a considerable improvement over earlier iterations. On SWE-bench Verified, the model achieved a 77.2% average score across ten trials with a 200,000-step reasoning budget. On OSWorld, it scored 61.4% across 100-step tasks, up from earlier scores of 42.2%. Expert reviews across finance, law, medicine, and STEM fields confirm marked advances in reasoning and mathematical skills compared with models such as Opus 4.1.

Supporting product updates include Claude Code 2.0, now featuring a Visual Studio Code extension and checkpoints for easy reversions, along with upgraded API tools for memory and context handling. The Claude app now integrates code execution and document creation across spreadsheets, slides, and text, while the Chrome extension is once again open to Max users.

Anthropic has also introduced ‘Imagine with Claude’, an experimental real-time software generator available as a short-term research preview.
