

Linux Foundation strengthens open source agentic AI With Solo.io's Agentgateway

The Linux Foundation is reinforcing its role as a neutral hub for open source agentic AI by bringing in another key project. Following Google's donation of the Agent2Agent (A2A) protocol in June and Cisco's contribution of AGNTCY in July, the Foundation has now welcomed Solo.io's Agentgateway.

Announced at the Open Source Summit Europe in Amsterdam, Agentgateway was originally launched as Gloo AI Gateway, an open source data plane designed for agent-to-agent and agent-to-tool communication. With a focus on security, observability, and governance, it supports both A2A and the Model Context Protocol (MCP) developed by Anthropic. Contributors already include AWS, Cisco, Huawei, IBM, Microsoft, and Red Hat.

Linux Foundation executive director Jim Zemlin described Agentgateway as a "secure management layer for interactions between AI agents" across diverse frameworks and protocols.

Lin Sun, vice president of Solo.io, highlighted its role in connecting agents and mediating traffic securely: "In a nutshell, Agent Gateway is serving as the gateway in between your agents, in between your agent and the MCP server, in between your agent and your large language model, to help mediate that traffic to apply security policies such as authentication, authorization, to be able to do governance and control and also provide observability on top of that."

RDK-B, standardises essential functions such as device management, telemetry, Wi-Fi services, Ethernet access and IPv6 transitioning. Compatible with DOCSIS,

GPON, DSL and Fixed Wireless Access, RDK-B enables service providers to deliver consistent broadband services across diverse SoCs and OEMs through a single open source software stack.

Oscar Gallego, director of home technology &

products at Vodafone Group, stated: "Success relies on the right technical choices, and for our next-generation broadband devices, that begins with RDK. Ultra Hub 7 unquestionably enables the most advanced broadband experience we've created to date, simultaneously delivering ultra-performance and unmatched value to our customers."

Jason Briggs, president of RDK, added: "Vodafone is clearly at the cutting-edge of broadband deployments with the new Ultra Hub 7 live in UK and Germany, and we're quite proud it runs atop of RDK. RDK-B is an open, agile, and proven broadband software stack built for scale."

pgEdge launches pgEdge Enterprise Postgres

PgEdge, a leading open source enterprise Postgres company, has announced the launch of pgEdge Enterprise Postgres, an enterprise-grade PostgreSQL distribution, alongside a full transition of its distributed Postgres components to open source licensing.

This move makes PgEdge one of the few companies offering a fully standard, fully open source Postgres solution supported for both distributed and non-distributed workloads. All distributed components—including Spock (multi-master logical replication), Large Object Logical Replication (LOLOR), and Snowflake Sequences—are now licensed under the permissive PostgreSQL License, approved by the Open Source Initiative, and are available on GitHub. Previously under the PgEdge Community License, these components now remove proprietary barriers, promoting broader adoption and community collaboration.
