

PgEdge Enterprise Postgres delivers enterprise-grade features such as high availability, full support for PostgreSQL v16, v17, and upcoming v18, enterprise-ready extensions like pgAudit, pgBackrest, pgBouncer, PostGIS, and pgVector, and browser and desktop-based management via pgAdmin. Deployment options include native packages for VMs and bare metal, containers for Kubernetes, OpenShift, Docker/Docker Swarm, and managed service availability via PgEdge Cloud.

The platform enables seamless scaling from a single Postgres instance to high availability with read replicas and Patroni, and even globally distributed deployments across multiple regions, ensuring extreme uptime and low latency.

Phillip Merrick, co-founder and CEO of PgEdge, said: “Customers have asked us to deliver and support enterprise-class Postgres for their non-distributed workloads, and we listened. The market is clear: organizations want fully standard, fully open source Postgres to power their most critical applications. PgEdge is proud to provide enterprise-grade Postgres solutions that scale with our customers’ needs—while reinforcing our long-term commitment to open source and the Postgres community.”

Tencent open sources Youtu-GraphRAG to advance accuracy in AI question answering

China-based Tencent has released Youtu-GraphRAG as an open source tool, positioning itself as a major contributor to the global AI research community. The

tool is designed to improve large language model (LLM) performance on complex question-and-answer tasks, where factual accuracy and reasoning reliability remain critical challenges.

At its core, Youtu-GraphRAG reduces inaccuracies and nonsensical responses often produced by AI when tackling nuanced or intricate enquiries. By leveraging advanced graph retrieval and reasoning mechanisms, it enables LLMs to access relevant, structured information, strengthening their ability to deliver accurate and contextually appropriate responses.

For developers, this open source release offers a practical pathway to refine models and push innovation in knowledge-intensive domains. Its integration is particularly significant in fields such as healthcare, finance, and customer service, where precision is paramount.

The move underscores Tencent’s commitment to transparency and collaboration within the AI community. By opening Youtu-GraphRAG to researchers and developers, Tencent aims to accelerate the creation of reliable conversational agents and intelligent systems that can handle complex queries without losing coherence or credibility.

Industry experts view the development as a pivotal step in advancing AI reasoning capabilities. As LLMs continue to permeate real-world applications, initiatives like Youtu-GraphRAG highlight the importance of building systems that are both trustworthy and aligned with real-world knowledge.

With this release, Tencent provides the AI ecosystem with a cutting-edge foundation to address one of the most pressing challenges in artificial intelligence, ensuring factual correctness in machine-generated responses.

Elon Musk’s X open sources code for the algorithm that powers the ‘For You’ timeline

Elon Musk’s X, formerly Twitter, has open sourced the latest version of its recommendation algorithm that powers the ‘For You’ timeline, marking a significant step towards algorithmic transparency.

Announcing the move, the platform’s engineering team said: “Today, as part of our effort to make our platform transparent, we are open sourcing the latest code used to recommend posts on the ‘For You’ timeline. Our algorithm is always a work in progress. We will continue to refine our approach to surface the most relevant content to our community.”

The team added: “For this release, we aimed for the highest possible degree of transparency, while excluding any code that would compromise user safety and privacy or the ability to protect our platform from bad actors, including undermining our efforts at combating child sexual exploitation and manipulation. Today’s release also does not include the code that powers our ad recommendations.”

The release covers the ‘For You’ recommendation engine but excludes advertising systems, safety-critical modules, and any code that could undermine privacy or security. By opening the algorithm, X is enabling developers, researchers, and the public to study, improve, and provide feedback on how content is curated.

This move reflects broader industry pressure in 2025 for technology companies to reveal how algorithms shape online experiences.
