

creating opportunities for innovation but also challenging established developers. Mullenweg acknowledged Automattic's responsibility to the community, writing in an internal memo, "I don't think that will happen without our contributions."

This pivot comes after a turbulent year marked by layoffs, legal disputes, and governance crises. Amid restructuring and a 16 percent workforce reduction, Automattic resumed full WordPress contributions in May 2025, signalling reconciliation. With competitors like Wix and Squarespace embedding AI into their platforms, Telex underscores Automattic's ambition to redefine open source development through AI and reclaim leadership in shaping the web's future.

Microsoft makes 6502 BASIC interpreter source code available on GitHub

Microsoft has officially released the original 6502 BASIC interpreter source code from 1976 as open source for the first time, marking a major milestone in the preservation of computing history. The release, published under the MIT licence, makes all 6,955 lines of assembly source code available on GitHub.

The interpreter was originally developed by Bill Gates and Ric Weiland for the MOS 6502 processor, and later became the foundation for the Commodore PET, VIC-20, and Commodore 64 computers. Millions of users learned to program using this BASIC, which continues to influence the retro computing community today.

Microsoft has chosen to release version 1.1 (1978), which introduced improved memory management in collaboration with John Feagans, a developer at Commodore. This version was distributed as BASIC V2 on the Commodore PET and remains preserved in ROM archives, emulators, and computer museums worldwide.

The open source release also includes well-documented Easter Eggs from Bill Gates. Hidden features such as the STORDO and STORD0 labels are present, along with the famous command WAIT 6502,1, which causes the word "MICROSOFT!" to appear on a Commodore PET running BASIC V2. Gates publicly confirmed these Easter Eggs in 2010.

Microsoft emphasised the historical importance of 6502 BASIC in shaping its earliest software contributions while acknowledging the role of the retro computing community, FPGA projects, and emulator developers in preserving the code over the decades.

This announcement follows Microsoft's 2020 decision to release GW-BASIC (1983) as open source, further highlighting the company's ongoing commitment to archival access, education, and experimental reuse of legacy software.

Ethereum Foundation shifts from open grants to curated open source funding

The Ethereum Foundation has paused open grant submissions for its Ecosystem Support Program (ESP), marking a major shift in its open source funding model. The

Reliance and Meta partner to build open source AI solutions for Indian businesses

Reliance Industries Limited (RIL) and Meta have announced a US\$ 100 million (₹855 crore) joint venture to create India-focused open source AI solutions. The announcement was made during RIL's 48th annual general meeting. Reliance will hold a 70% stake, while Meta will retain 30%, with the deal expected to close in Q4 2025 pending regulatory approvals.

The venture will be built on Meta's open source Llama (large language model Meta AI) technology, adapted for enterprise-level AI applications. Its goal is to provide businesses of all sizes—small, medium, and large—with generative AI tools tailored for functions such as sales, marketing, IT, customer service, and finance.

Companies will gain access to a secure, full-stack environment for customisation and deployment of AI solutions, along with a suite of ready-to-use applications. Deployment options will include cloud, on-premises, and the joint venture's own infrastructure, enabling cost-efficient flexibility.

Reliance will focus on deploying and scaling solutions through its infrastructure and industry reach, while Meta will supply its Llama models and global AI expertise.

Mukesh Ambani, chairman and MD of RIL, said: "Combining Meta's advanced AI models with Reliance's operational expertise will help Indian companies innovate faster, improve efficiency, and strengthen their competitiveness in global markets."

Mark Zuckerberg, CEO of Meta, added: "We're excited to deepen our partnership with Reliance to bring the power of open source AI to Indian developers and enterprises. Through this joint venture, we're putting Meta's Llama models into real-world use, and I'm looking forward to Meta expanding its footprint in the enterprise space as we unlock new possibilities together."
