

improving English fluency, and receiving language learning tips.

Next, let us explore a few custom GPTs from the category Programming. My top pick here is Code Copilot. To test its capabilities, I used a program from an article I wrote for *OSFY* nearly a decade ago, on the topic of esoteric programming languages. The article is available on the *OSFY* portal at: <https://www.opensourceforu.com/2018/02/exercise-mind-exotic-programming-languages>. Esoteric programming languages are deliberately designed to be difficult to program in, understand, and debug. For my test, I chose a program written in a language called Brainfuck—not the politest name, I admit. The program is shown below, and yes, it is valid! Back in the days before ChatGPT, writing such a program was indeed a tedious and time-consuming task.

```
+++++[>+++++<-]>+++++.
>+++++[>+++++<-]>.
>+++++[>+++++<-]>-.
>+++++[>+++++<-]>+++++.
>+++>+++++<->++.
>+++++[>+++++<-]>++.
>+++++[>+++++<-]>+++++.
>+++++[>+++++<-]>+++++.
>+++++[>+++++<-]>++.
>+++++[>+++++<-]>+++++.
>+++++[>+++++<-]>-.
>+++>+++++<->++.
>+++++[>+++++<-]>.
>+++++[>+++++<-]>+++++.
>+++++[>+++++<-]>++.
>+++>+++++<->++.
>+++++[>+++++<-]>-.
>+++++[>+++++<-]>+++++.
>+++++[>+++++<-]>+++++.
```

I simply copy-pasted the code into both ChatGPT and Code Copilot without providing any additional hints. Both quickly recognised it as Brainfuck code. However, ChatGPT confidently—but incorrectly—predicted that the program would print ‘HELLO CHATGPT’, whereas Code Copilot correctly identified the output as ‘OPEN SOURCE

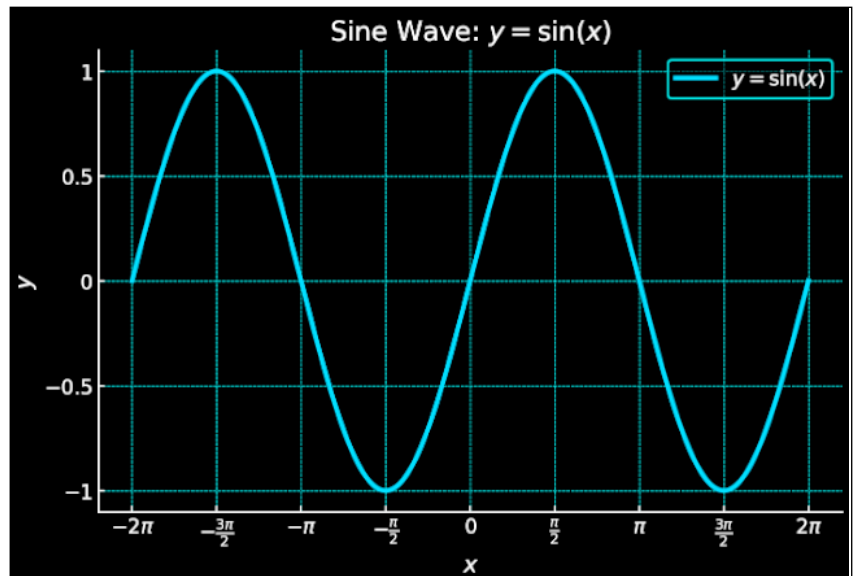

Figure 2: Graph made in Math GPT

FOR YOU’. So, in this round, full marks go to Code Copilot. Furthermore, Code Copilot was the only custom GPT that managed to correctly decode another program written in an even more bizarre language called Ook! (from the same article mentioned above). I encourage you to try it yourself and see the results. There are also other custom GPTs in this category that can assist with a wide range of languages and tools, including HTML, CSS, JavaScript, Laravel, SQL, R, etc.

Now, let us look at some of the custom GPTs featured in the Productivity category. My pick here is Canva. Although I am not a designer myself, I found the results it produced quite impressive. Another noteworthy tool in this category is Resume, which I found particularly useful. This category also includes custom GPTs for generating PDFs, presentations, images, diagrams, etc.

The Writing category includes custom GPTs that even claim to write entire novels for you. Interestingly, the large number of GPTs promising to

‘humanize’ AI-generated text highlights the ongoing triangular battle between AI text generators, AI-based text detectors, and AI humanizers.

Another category of custom GPTs is DALL·E, named after OpenAI’s text-to-image model. This category includes GPTs capable of generating animations, logos, and a wide variety of other visuals, along with numerous specialised image-generation tools.

Finally, there is the Lifestyle category, which offers a variety of custom GPTs that provide advice on light-hearted, everyday topics. The next time you have some free time, it might be fun to explore and experiment with a few of them.

Now, it is time to wind up the article. There are two key takeaways to keep in mind. First, ChatGPT is just the tip of the iceberg—the world of AI tools is far broader and richer. Second, new custom GPTs are emerging almost every day, so it is worth browsing the list from time to time. You may just discover a surprisingly powerful tool that can cut your workload in half. **END** 🐧
