

AMD to train 100,000 Indian graduates in AI and GPU programming

AMD has announced a major workforce development initiative to strengthen open source GPU programming skills in India. Over the next three years, the company will train 100,000 STEM graduates in artificial intelligence (AI) and GPU programming, with a focus on open source development.

Alongside training, AMD will provide 100,000 hours of free developer cloud access to researchers and startups in India. The programme is designed to promote open ecosystems, support the country's rapidly expanding startup sector, and accelerate digital transformation initiatives.

Mark Papermaster, chief technology officer and executive vice president at AMD, said: "This initiative removes cost and complexity barriers for startups and independent developers by opening access to AMD GPUs for training and development: no hardware procurement, no heavy upfront spend. Democratising compute will accelerate India's next generation of innovators and strengthen the open source community."

Jaya Jagadish, senior vice president and country head at AMD India, added: "We are not just training programmers; we are building the workforce that will drive India's AI economy. When these skilled professionals enter the market with cutting-edge GPU programming expertise, that will create a multiplier effect across industries, directly contributing to India's economic growth trajectory."

scraping. The protocol aims to provide AI companies like Google, Anthropic, and OpenAI a legal way to use online data for training models without facing lawsuits.

The move comes amid mounting legal battles. AI companies have been accused of scraping data without consent, with Anthropic recently settling a copyright lawsuit with book authors for US\$ 1.5 billion. More than a dozen lawsuits are still pending in US courts against Google, Midjourney, and others.

Developed by the non-profit RSL Collective, RSL is built on the familiar Really Simple Syndication (RSS) standard. Like RSS, it can process diverse content types — from web pages and books to datasets and videos — at scale. Its machine-readable design enables automated crawlers to process licensing terms without manual oversight.

"We need to have machine-readable licensing agreements for the internet. That's really what RSL solves," said Eckart Walther, co-founder of RSL Collective. Co-founder Doug Leeds also backed the initiative, which has gained early support from publishers like Medium, Mashable, CNET, and WebMD.

The tension between AI companies and publishers remains high. Google's AI Overview feature has drawn criticism for displaying AI-generated summaries above search results, which publishers claim has significantly reduced their web traffic. While groups like the Dataset Providers Alliance previously called for transparent data practices, RSL is the first attempt at a licensing framework that could work at real-world scale.

By positioning itself as an 'RSS for AI licensing', RSL underlines its open source DNA. Whether the initiative can gain traction depends on AI giants' willingness to adopt a system designed for transparency and legal clarity.

Vodafone rolls out Ultra Hub 7 routers in Europe

Vodafone has adopted RDK-B as the central open source software foundation for its next-generation Wi-Fi 7 Fibre and DOCSIS CPEs, branded as Ultra Hub 7 routers. The routers are already commercially deployed in the UK and Germany, with phased rollouts continuing across Europe.

In the UK, Vodafone's new Pro 3 package includes the Ultra Hub 7 router, purpose-built for full-fibre and powered by Wi-Fi 7. Customers benefit from the company's Super Wi-Fi 7 Booster, supplied as standard, with up to three additional mesh boosters available at no extra cost. In the event of broadband outages, users are automatically switched over to Vodafone's 4G network to maintain uninterrupted connectivity.

RDK, or Reference Design Kit, is an open source software platform now deployed on more than 200 million devices worldwide. Its broadband variant,
