

hosted on Azure, you can use Azure Copilot to pinpoint the root cause of the problem by giving the prompt: “Diagnose latency issues for the web application in subscription XYZ using Azure Copilot.”

Azure Copilot analyses the application, inspects network configurations, and reviews recent deployment changes. It identifies a misconfigured load balancer as the source of the latency, offering recommendations to rectify the issue.

Figure 1 demonstrates Azure Copilot’s diagnostic output, pinpointing network misconfigurations and suggesting optimal settings.

Review and optimisation of cloud services

Optimising cloud services is pivotal for ensuring cost-efficiency and performance. Azure Copilot offers insights and recommendations, facilitating informed decision-making.

Consider a scenario where your cloud storage costs are unexpectedly high. You can use Azure Copilot to

review storage utilisation and optimise costs. The prompt is: “Analyse and optimise storage usage in subscription ABC with Azure Copilot.”

Azure Copilot reviews storage metrics, identifies underutilised resources, and recommends actions such as tier adjustments or data archiving to reduce costs.

Figure 2 illustrates Azure Copilot’s cost-saving recommendations, highlighting underutilised resources and suggesting alternative storage options.

Improving cloud governance

Effective cloud governance ensures compliance, security, and efficient resource management. Azure Copilot assists in establishing and enforcing governance policies.

As an example, to enhance governance, you may want to enforce tagging policies across resources. Azure Copilot can help automate this process. You can use the prompt: “Implement and enforce tagging policies for resources in subscription DEF using Azure Copilot.”

Azure Copilot automates the tagging process, ensuring all resources adhere to the defined policies, thereby improving visibility and management.

Figure 3 showcases Azure Copilot’s enforcement of tagging policies, ensuring consistent resource categorisation and governance.

Developing script templates for cloud operations

Script automation enhances operational efficiency. Azure Copilot aids in developing and deploying script templates tailored to specific cloud operations.

Suppose you need a script to automate backup operations for databases. Azure Copilot can help generate the necessary script template. You can give the prompt: “Create a script template for automating database backups in subscription GHI using Azure Copilot.”

Azure Copilot generates a PowerShell script template that automates the backup process, including scheduling, retention policies, and notification settings.
