
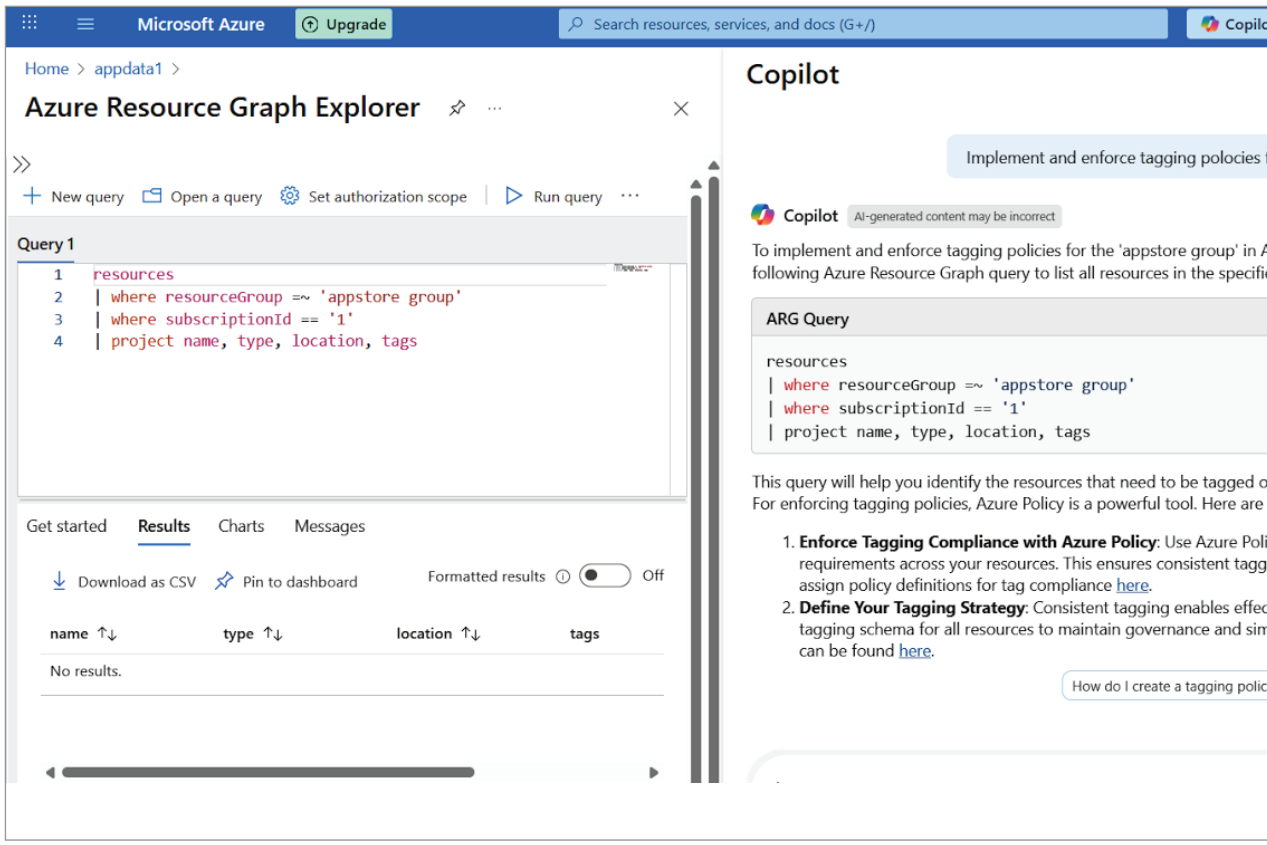

Figure 3: Azure Copilot's enforcement of tagging policies

Figure 4 displays the detailed script template generated by Azure Copilot, ready for deployment and customisation.

Understanding cloud subscription details

Gaining insights into cloud subscriptions is crucial for effective management. Azure Copilot provides detailed subscription analytics, facilitating informed decisions.

To understand usage patterns and billing details, you can utilise Azure Copilot for a comprehensive subscription analysis by giving the prompt: *"Provide a detailed analysis of subscription usage and billing for subscription JKL using Azure Copilot."*

Azure Copilot offers an in-depth analysis of subscription usage, billing trends, and identifies areas for cost optimisation.

Figure 5 illustrates the subscription analysis generated by Azure Copilot, highlighting key usage metrics and cost-saving opportunities.

Azure Copilot for reviewing cloud architecture

Azure Copilot reviews a workload by reading your actual Azure environment with natural-language prompts. This is what it reads:

- ***Control plane context:*** Subscriptions, resources, RBAC, policies, tags, and telemetry accessible to your identity.
- ***Best-practice baselines:*** Azure Well-Architected Framework pillars and the Well-Architected Review assessment.
- ***Built-in recommendations:*** Azure Advisor findings are mapped to the same pillars for reliability, security, performance, and operations.
- ***Security posture:*** Defender for Cloud recommendations with Copilot summaries, delegation, and 'Fix with Copilot'.

The end-to-end review procedure is as follows.

Prereqs: Ensure Copilot in Azure is enabled in your tenant and you have least-privilege access to the target subscriptions and resource groups.

Scope the review: In Azure Portal, open Copilot and specify scope: subscription(s) or a resource group. Ask: *"List my top Advisor recommendations by pillar for subscription X."* Copilot returns the linked Advisor items.

Establish the baseline: Run or import a 'Well-Architected Review' for the workload. Use Copilot to summarise gaps per pillar and cross-reference Advisor items.

Security deep-dive: In Defender for Cloud, open *Recommendations → Summarize with Copilot* to get a plain-language risk brief. Use *Generate*
