message to delegate or *Fix with Copilot* to apply guided remediation or scripts. Track Secure Score impact.

Reliability review: Ask Copilot: “Show reliability risks for RG Y.” Prioritise ZRS/GZRS storage, availability zones, health probes, backup/restore, and failover patterns. Map each task to Advisor reliability items.

Performance efficiency: Query Copilot for performance recommendations and hotspots. Validate service-specific advisors (for example, Azure SQL Database performance advisors) and right-size SKUs.

Cost optimisation: Ask: “Summarise my last 30 days of cost outliers and savings opportunities.” Copilot surfaces cost-focused Advisor items and Cost Management insights for idle, over-provisioned, and orphaned resources. Optionally configure Advisor

digests for ongoing alerts.

Operational excellence: Request: “List monitoring and diagnosability gaps for workload Z.” Copilot summarises missing alerts, logging, and deployment hygiene aligned to the Well-Architected pillar.

Document and track: Ask Copilot to “Summarise this review and list the next actions by the owner and pillar.” Export linked recommendations. Re-run the scope weekly to verify posture drift and secure score movement.

Azure Copilot for cloud operations

Azure Copilot transforms the way organisations approach cloud operations. By delivering personalised assistance in monitoring, cost reporting, and resource management, it empowers users to make informed decisions,

enhance efficiency, and maintain control over their cloud environment.

Monitoring cloud infrastructure: Azure Copilot provides real-time visibility into the health and performance of your cloud resources. With its conversational interface, users can easily enquire about the status of virtual machines, network traffic, or application performance. Instead of sifting through dashboards, simply ask Copilot for updates or specific metrics. This approach enables swift detection of anomalies, making it easier to take proactive measures and ensure optimal system reliability.

Cost reporting and optimisation: Managing expenses in the cloud is a crucial aspect of any organisation’s strategy. Azure Copilot offers tailored insights into spending patterns and resource utilisation. You can request
