

Firefox's latest update faces criticism over high CPU use and battery drain

Mozilla's latest Firefox update, version 141, has rolled out AI-powered tab grouping as a headline feature — but instead of streamlining browsing, it is drawing criticism from users who report heavy CPU usage, increased memory demand, and rapid battery drain.

The feature, which uses an on-device artificial intelligence model to detect related tabs, group them, and assign descriptive names, was presented as a productivity boost. Users can even click 'Suggest more tabs for group' to expand sets with additional AI-recommended pages.

However, multiple reports on the Firefox subreddit suggest the performance cost is outweighing the benefits. One user, u/st8ic88, found their device struggling after the update: "I don't want this garbage bloating my browser, blowing up my CPU, and killing my battery life. There is absolutely no reason for it, it's not a good feature, and it's absolutely humiliating for Firefox to be jumping on this bandwagon."

Another user monitoring their system in Conky noted that the 'Inference' process — believed to handle Firefox's AI tasks — was responsible for the resource spike. Terminating the process caused the browser to crash, requiring a restart. Others mentioned "fans spin like crazy" or memory usage climbing far above normal levels.

stems from a US court ruling in 2024 that found Google had maintained an unlawful monopoly in online search. The US Justice Department has suggested selling Chrome as a remedy, though Google plans to appeal any such divestiture order, a process that could take years.

Analysts remain sceptical about the likelihood of the deal going through.

Industry experts say Google is expected to resist selling Chrome, opting instead to fight the legal battle.

Founded in 2022 by Srinivas along with Denis Yarats, Johnny Ho, and Andy Konwinski, Perplexity has quickly gained recognition for its AI-powered 'answer engine', which delivers conversational, cited responses rather than traditional search links. The company has also been developing its own AI browser, Comet, currently in invite-only testing, and acquiring Chrome could potentially expand its reach to over three billion users worldwide.

Space-ng announces its Sol3 ecosystem for computer vision in space

Space-ng has introduced its Sol3 hardware and software ecosystem at the 39th Annual Small Satellite Conference in Salt Lake City, Utah in the US. Designed for open-architecture computer vision in space, Sol3 combines a low-cost hardware development kit (HDK) with a free software development kit (SDK) available for evaluation, academic research, and non-commercial projects.

The Sol3 platform supports up to 12 configurable camera modules, enabling rapid prototyping, testing, and development in both lab and field environments. Its SDK unlocks the hardware's full computing and sensing capabilities, supporting applications

ranging from autonomous navigation to spacecraft operations. The system is equipped with GPU acceleration, neural processors, hardware encoders, high-resolution imaging, and integrated IMUs. Developers can also work with modern environments such as C++20, Linux, and containerisation. Sol3 integrates with leading open source libraries including OpenCV, PyTorch, GTSAM, ceres-solver, and Eigen.

According to CEO Ethan Rublee, the decision to provide free SDK access for non-commercial use reflects the company's goal of empowering researchers and fostering innovation in spaceflight software.

Built as an open, software-defined solution, Sol3 addresses the entire spacecraft lifecycle—covering design, testing, integration, simulation, and mission operations. Key focus areas include optical navigation, lunar landings, autonomous rendezvous and proximity manoeuvres, and improved space situational awareness.

Orders for the Sol3 HDK base unit and camera modules are now open. Meanwhile, the SDK, complete with an emulation environment and documentation, is available online via evaluation licence.

Alibaba's Qwen3 Coder cuts into Anthropic, Google market share

Alibaba's new open source coding model, Qwen3 Coder, is beginning to reshape the competitive AI landscape, showing early signs of denting the market share of established players such as Anthropic and Google.
