

According to OpenRouter, which tracks requests routed to different AI systems, the model has moved up sharply since its late July release. In mid-July, Anthropic's Claude Sonnet 4 commanded 46.3% of usage share on the platform, while Google's Gemini 2.5 Pro accounted for 13.4%. By the week of August 11, Claude's share had fallen to 32.3% and Gemini slipped to 5.8%. Over the same period, Qwen3 Coder climbed to 20.7%, reflecting fast adoption among developers.

Qwen3-Coder-480B-A35B-Instruct, the technical name for the model, is designed as a Mixture-of-Experts (MoE) system. It has 480 billion total parameters, with 35 billion active per forward pass (8 out of 160 experts). The model is built

for tasks such as function calling, tool use, and long-context reasoning across code repositories.

Unlike its American counterparts, Qwen3 Coder is open source. This gives developers the ability to adapt it for specific

applications, an advantage not possible with closed source offerings.

For Alibaba, the success of Qwen3 Coder comes at a time when its core e-commerce business is seeing slower growth. The model's uptake signals progress in the company's broader push into AI, particularly in open source innovation where China is aiming to match or overtake Western rivals.

Qwen3 Coder's rise is part of a wider trend in China's AI ecosystem, alongside models such as DeepSeek, Kimi K2, and Z.ai. Analysts suggest that the momentum around Alibaba's model could strengthen the company's positioning in AI and potentially influence its longer-term business prospects.

Neo4j onboards Ish Thukral as general manager for India and SAARC

Neo4j has announced the appointment of Ish Thukral as general manager for India and the SAARC region, reinforcing the company's strategic focus on the subcontinent. Operating from New Delhi, Thukral will oversee the regional expansion

Ish Thukral, general manager,
Neo4j, India and SAARC

of Neo4j's operations, with a strong emphasis on growing customer engagements and building a robust partner network.

With over 20 years in the enterprise tech industry, Thukral has held leadership roles at Amazon Web Services (AWS), Oracle, and Ingram Micro. Across these organisations, he was closely involved in developing growth strategies, supporting ecosystem development, and driving customer success across high-growth segments.

Thukral's role comes at a key moment for Neo4j, which formalised its India entity in 2024.

His appointment is part of a broader effort to scale the company's regional footprint in 2025, including new hires across sales, partner operations, and field roles. This expansion is aligned with the rising adoption of graph database solutions across critical sectors such as banking and financial services, telecom, and public sector enterprises.

Commenting on the announcement, Kristen 'KP' Pimpini, vice president and general manager, APAC, Neo4j, said: "I am thrilled to have Ish join Neo4j to supercharge our talented Indian team in such an exciting marketplace, as he brings a strong track record, deep market experience, and a customer-first mindset.

Hugging Face introduces an open source, no-code toolkit

Hugging Face has launched AI Sheets, an open source, no-code toolkit that lets users work with datasets using thousands of AI models. Designed to resemble a spreadsheet, the platform lowers barriers to AI-driven data management by allowing dataset creation, transformation, and enrichment without programming skills.

AI Sheets presents itself like a traditional spreadsheet interface where users can create new columns by writing prompts, clean up existing datasets, or generate synthetic data. Hugging Face said the tool can run locally on a personal computer or be deployed through its Hub and Spaces, making it accessible to developers, educators, and researchers alike.

The toolkit supports a wide range of tasks, including model comparison, prompt testing, classification, analysis, and data enrichment. A feature allows LLMs to act as judges, evaluating or comparing responses side by side.

AI Sheets offers an entry point for non-technical users such as business analysts, teachers, or researchers who want to test or refine prompts, run comparisons, or clean data. Community responses on Reddit have already highlighted its simplicity and open source availability.

Hugging Face said the release is aligned with its mission of "making AI tools more transparent and accessible." The company has not announced commercial plans for AI Sheets, underscoring its commitment to transparency and adaptability rather than monetisation.
