

Proto Rig: Modular bitcoin mining system from Block

Block, Inc. has unveiled Proto Rig, a modular and repairable bitcoin mining system, alongside Proto Fleet, a free open source fleet management platform. The launch represents a new approach to mining infrastructure, aiming to improve efficiency, reduce downtime, and broaden access to bitcoin mining.

These releases follow Block's previous sale of mining chips to Core Scientific. Proto Rigs are already deployed at Core Scientific's Dalton, Georgia facility, forming part of its operational mining fleet. Traditional mining machines are often single-use, prone to failure, costly to repair, and difficult to upgrade. Proto Rig addresses these issues with a design intended to last up to 10 years. Its modularity allows operators to replace individual hashboards instead of entire units, lowering upgrade costs by 15–20% per cycle. Tool-free maintenance reduces repair time from days to seconds, cutting downtime significantly.

"Mining hardware hasn't really changed in years," said Thomas Templeton, hardware lead at Block. "Machines break often, are hard to repair, expensive and time-consuming to upgrade, and don't make the most efficient use of power or space. With Rig, we set out to change all of that—and contribute to hardware decentralization in the process."

Proto Rig also delivers 1.5 times the power density per rack foot compared with legacy systems and is compatible with both modern and existing infrastructure, allowing operators to integrate the system without expensive retrofits.

On the software side, Proto Fleet combines power scaling, monitoring, diagnostics, and maintenance tools into a single platform. By offering this software for free, Block aims to simplify operations for miners of all sizes and reduce reliance on fragmented proprietary tools.

He joins at a pivotal moment for Neo4j, as the company enables enterprises across India to transform their data into knowledge, unlocking insights for better business decisions and underpinning their AI models for more accurate, transparent, and explainable results."

Graph technology is increasingly being deployed for advanced use cases such as fraud detection, cybersecurity, customer 360, and other AI-powered solutions that rely on connected data. Thukral's leadership is expected to help organisations across India and SAARC unlock these opportunities more effectively.

Red Hat is still a Leader in the 2025 Gartner Magic Quadrant for CNAP

Red Hat has been recognised as a Leader in the 2025 Gartner Magic Quadrant for cloud-native application platforms (CNAP) for the second year in a row. The recognition highlights the strength of Red Hat OpenShift, the industry's hybrid cloud application platform built on Kubernetes. OpenShift was acknowledged for both its 'Completeness of Vision' and 'Ability to Execute'.

"We believe being recognised as a Leader for a second consecutive year in the Gartner Magic Quadrant for Cloud-Native Application Platforms is a testament to Red Hat OpenShift's sustained innovation and its critical role in enabling enterprises to navigate the complexities of modern application development," said Mike Barrett, vice president and general manager, hybrid cloud platforms, Red Hat.

This recognition affirms OpenShift's role in helping organisations build, deploy, and manage cloud-native applications across hybrid and multi-cloud environments—from traditional data centres to the edge. The platform delivers a consistent operational experience across virtualised and containerised workloads, supported by robust developer tools, enterprise-grade security, and integrated compliance features. These capabilities enable enterprises to accelerate digital transformation, modernise IT infrastructure, and drive innovation at scale.

As organisations increasingly pursue AI/ML initiatives, OpenShift continues to evolve, offering a flexible foundation that can power a broad spectrum of emerging workloads. Its open, multicloud strategy positions the platform as a cornerstone for next-generation, AI-driven enterprise applications.

The 2025 Gartner Magic Quadrant for Cloud-Native Application Platforms evaluated 12 vendors on stringent criteria around vision and execution. Gartner defines Leaders as vendors who perform strongly against their current vision and demonstrate the capacity to shape the market's future direction.

ATIS and Linux Foundation partner to advance open and intelligent 5G/6G network deployment

The Alliance for Telecommunications Industry Solutions (ATIS) has signed a memorandum of understanding (MOU) with the Linux Foundation, formalising their collaboration to accelerate progress towards open, intelligent, and sustainable next-generation networks, including 5G and 6G.

Through the partnership, the two organisations will align efforts across Linux Foundation Networking (LFN) and open RAN software projects, combining the strengths of open standards and open source. The initiative is expected to advance secure, sustainable, and intelligent network deployment worldwide.

"By working with the Linux Foundation, we are uniting the strengths of open standards and open source to accelerate deployment of secure and intelligent next-generation networks," said Susan Miller, president and CEO of ATIS. "This collaboration reinforces our shared vision of sustainable and interoperable network architectures."
