

The Linux Foundation echoed this commitment, emphasising the importance of building globally interoperable ecosystems. “The Linux Foundation and its projects across LF Networking and beyond are focused on creating an open ecosystem that supports innovation across the networking stack—from RAN to core to edge,” said Arpit Joshipura, GM of networking, edge, and IoT at the Linux Foundation. “Our work with ATIS brings the best of open source and standards together to advance 5G/6G, strengthen security, and expand ecosystem engagement.”

This agreement strengthens synergies between standards development and open source communities, critical for enabling next-generation technologies such as open RAN, edge computing, and AI-driven network intelligence. By bridging innovation across multiple layers of the network, ATIS and the Linux Foundation aim to accelerate global 5G rollout and lay the foundation for 6G evolution.

Thunderbird 142 comes with major enhancements

The Thunderbird team has announced the release of Thunderbird 142, the newest stable version of the free, open source, and cross-platform email client available for GNU/Linux, macOS, Windows, and Android.

Among the most notable enhancements, Thunderbird 142 introduces support for adding visual signatures to PDF attachments opened within the client—an important step forward for users who rely on Thunderbird for document workflows. The release also includes a new ‘Reset Folder Order’ option to restore default folder sorting in the pane, along with expanded folder copy support within both mail server accounts and local folders.

The update further improves usability by adding ‘Copy Message Link’ and ‘Copy News Link’ options under the header pane’s ‘More actions’ menu, while removing the now redundant ‘Copy Message Location’ entry from the mail context menu.

Thunderbird 142 also delivers a wide range of bug fixes and performance improvements. These address issues with notification sounds, Fastmail calendar support, email sending from unified or local folders, dark message mode, and the alphabetical sorting of new

SUSE recognised as a Leader in The Forrester Wave: Multicloud Container Platforms, Q3 2025

SUSE has announced its recognition as a Leader in The Forrester Wave: Multicloud Container Platforms, Q3 2025, for its platform SUSE Rancher Prime. The report evaluated how multicloud container platforms are evolving to meet enterprise demands—either by strengthening capabilities across cloud, data centre, and edge environments or by targeting specialised use cases such as AI and industrial operations.

“To us, this recognition as a Leader validates what our customers already know: SUSE is built for composability, performance, and flexibility,” said Peter Smails, SVP and general manager, cloud native at SUSE. “We enable enterprises to run securely across the edge, in the cloud, and in the data centre—without compromise. With our open source foundation and customer-first support model, SUSE Rancher Prime delivers digital sovereignty, optimised cloud costs, enhanced security and compliance, and resilient business operations.”

SUSE Rancher Prime has become the trusted partner for organisations such as Aussie Broadband, Lumen, and Switch. As a unified, self-service Kubernetes platform, it simplifies cloud-native transformation, accelerating time-to-market, and ensuring enterprise-grade security and compliance across any environment. Its design ensures vendor independence while maintaining flexibility and scalability to meet the unique needs of modern enterprises.

Backed by decades of SUSE’s open source innovation and leadership, Rancher Prime empowers organisations to modernise application strategies with confidence. Whether supporting AI-driven workloads, industrial deployments, or mission-critical enterprise systems, Rancher Prime offers a robust and future-ready foundation.

This recognition underscores SUSE’s commitment to delivering open, secure, and innovative solutions that help customers thrive in an increasingly complex multicloud world.
