

ChatOps and LLMOps: Integrating AI Chatbots with DevOps and LLMs

Chatbots are becoming increasingly intelligent, thanks to technologies like ChatOps and LLMOps that help to integrate them with DevOps and LLMs.

Generative AI-based chatbots are today being used in many domains, including programming and code development, business problem solving, accounting, data analytics, and multimedia content creation, enhancing their performance and productivity. The market for AI and generative AI-based chatbots is increasing exponentially and helping solve complex problems in the least time without the need for human expertise. According to Statista, the AI market size in 2025 is projected to be more than US\$ 200 billion. At an annual growth rate of around 26%, this market will cross 1 trillion US dollars in 2031.

AI chatbots are making use of large language models (LLMs) at the backend, which are trained on humongous data related to multiple disciplines. Popular LLMs include GPT, BERT, LLaMA, Phi, OpenChat, and Gemma.

Integration of chatbots, DevOps and LLMs

The integration of DevOps with AI chatbots and LLMs is leading to improved performance in applications related to industrial automation, server management, log management, and many others.

ChatOps and LLMOps help develop AI chatbots for running automated tasks, getting regular alerts, and controlling automated industrial scenarios, all from a single chat window or common dashboard.
