

Linux 6.6 LTS powers new version of Raspberry Pi OS

The Raspberry Pi Foundation has released a new version of their Debian-based Raspberry Pi OS operating system for Raspberry Pi single-board computers. This update includes a new Linux 6.6 long-term supported kernel.

While still based on Debian GNU/Linux 12 'Bookworm', Raspberry Pi OS now uses the Linux 6.6 LTS kernel, a significant upgrade from the previous Linux 6.1 LTS kernel. Additionally, this update includes the latest Chromium 122 and Mozilla Firefox 123 web browsers.

The new release offers better support for the latest Raspberry Pi 5 SBC by improving the handling of the power button. It also adds new settings for headless resolution to the Screen Configuration, removing the setting of headless resolution for Wayland from Raspberry Pi Configuration.

This update improves compatibility with alternative window managers, enhances the new dark theme introduced in the previous release, speeds up the opening of the Bluetooth and Network menus, and replaces popover windows from the taskbar with conventional windows. The shutdown assistant was updated to close all user processes when logging out, and the audio icon on the taskbar is now hidden by default if no audio devices are connected.

Other improvements include an alternative mouse cursor shown during drag-and-drop operations, updates to the raspi-config utility to allow EEPROM updating, and improvements to the WayVNC VNC server for better compatibility with various VNC clients and *systemd* control.

Malayalam, and Marathi, with aspirations to extend their capabilities to all 22 Indian languages.

Hanooman is set to have multimodal AI capabilities for generating text-to-text, text-to-speech, text-to-video, and vice versa content. SML is already in discussions with BFSI enterprises, healthcare organisations, and mobile app providers to offer model-as-a-service or create specialised models by fine-tuning the Hanooman series. The first among these fine-tuned versions is the healthcare model VizzhyGPT, trained on large data of multiomics, clinical research, and electronic medical records.

Vardhan highlighted that one of the major challenges in building Indian LLMs is sourcing quality datasets in Indian languages. The first hurdle is to improve the quality of these datasets, whether in text, audio, or video format, as organisations currently use synthetic datasets created by translating from other languages, which may increase the chances of inaccuracies or hallucination.

The announcement was made on the sidelines of the Nasscom Technology and Leadership Forum in Mumbai. The BharatGPT ecosystem is a research consortium led by IIT Bombay, involving seven other IITs, and is supported by the Department of Science and Technology, SML, and Reliance Jio.

KaOS Linux 2024.03 released

KaOS Linux 2024.03 has been released with significant updates and improvements. This release sees the removal of GTK2 packages from the repositories, as they are
