

5. **Diversity, non-discrimination, and fairness:** AI systems should be designed and used to avoid discrimination and societal biases.
 6. **Environmental and societal well-being:** AI development should consider environmental sustainability and societal impact.
 7. **Accountability:** Developers and users of AI should be accountable for the system's consequences.
- **The Organization for Economic Co-operation and Development (OECD):** The OECD's 'AI Principles' outline nine core principles for responsible AI development, focusing on human well-being, fairness, accountability, transparency, and safety.
 - **Other organisations:** Several other entities, including UNESCO, the Institute of Electrical and Electronics Engineers (IEEE), and the Association for the Advancement of Artificial Intelligence (AAAI), have also developed their own sets of ethical guidelines and recommendations for AI development.

Key points of industry standards and guidelines

While specific details may vary, some key themes emerge across these different standards and guidelines.

- **Human-centred approach:** Emphasises that AI should be developed and used for the benefit of humanity, prioritising human well-being and respecting fundamental rights.
- **Fairness and non-discrimination:** Combating bias and discrimination in AI systems is crucial to ensure fairness and equal opportunities for all.
- **Transparency and explainability:** Developers and users should understand how AI systems work, and users should be aware when interacting with an AI system.
- **Accountability and responsibility:** Establishing clear lines of

accountability for the development, deployment, and use of AI systems is essential.

- **Privacy and data protection:** Ensuring ethical handling of personal data used in AI systems and respecting individual privacy.
- **Safety and security:** Implementing safeguards to prevent harm and potential misuse of AI systems.

However, there are a few challenges.

- **Implementation and enforcement:** Translating these guidelines into practical implementation and ensuring effective enforcement remains an ongoing challenge.
- **Global consistency:** Achieving consistency and harmonisation of ethical AI standards across different countries and regions is crucial for responsible development and deployment.
- **Continuous evaluation and adaptation:** As AI technology evolves, ethical frameworks and guidelines need to be continuously evaluated and adapted to address new challenges.

intelligence to combine skills like personality, empathy and knowledge. BlenderBot 3 has an exceptionally intelligent conversational AI agent to converse naturally with users. It incorporates what we term as 'AI fairness' and avoids bias in chat responses by learning and improvising its responses based on user feedback and response to chat results by classifying offensive, unrelated, problematic languages. It collects data from news feeds, classifies the truthfulness of the information, and then responds to user queries.

BlenderBot 3 has a built-in web crawler framework to seek responses for chat queries, and uses algorithms like SeeKer and Director to learn from user responses and rank them for fairness and relevance. Its self-learning capability recognises unhelpful and tricky responses where the user tries to trick the model and makes sure that fair responses are provided.

Currently, BlenderBot 3 is in beta and available in some regions. It is being tested to make it more effective. However, its general availability (GA) release is expected to answer almost any question with fairness and without bias. **END** 🐼

Collaborative efforts to create responsible AI systems

Meta's BlenderBot has been handling conversational AI with cognitive
