

Electrolux Group joins Open Invention Network

The Open Invention Network (OIN) has welcomed Electrolux Group, a global leader in home appliances, as its newest community member. This partnership underscores Electrolux's commitment to leveraging open source technology to drive innovation and sustainability in its intelligent appliance platforms.

Keith Bergelt, CEO of OIN, expressed his enthusiasm for Electrolux's decision to join the network, highlighting the critical role of open source software in advancing the capabilities and intelligence of modern appliances. He emphasised the importance of patent non-aggression in core Linux and adjacent open source technologies, which is a fundamental principle of the OIN community.

Fabio Albanese, head of engineering, connected electronics platform at Electrolux, echoed the sentiment, stating that integrating cutting-edge technologies is essential for improving the sustainability and overall performance of their appliances. He expressed Electrolux's pleasure in joining OIN and supporting its mission to protect open source software from patent litigation.

OIN's community members adhere to a policy of patent non-aggression, which involves cross-licensing Linux system patents to one another without royalty fees. This collaborative approach fosters a supportive environment for innovation in open source technologies.

AI chatbots. The evaluation involved ChatGPT responding to psychological survey questions and participating in interactive games, with its choices compared to those of 108,000 individuals from over 50 countries.

The study's lead author, Qiaozhu Mei, a professor at U-M's School of Information and College of Engineering, noted that AI's behaviour, characterised by increased cooperation and altruism, might be particularly suitable for roles that require negotiation, dispute resolution, customer service, and caregiving.

Another recent study has shed light on the personality traits and behavioural tendencies of artificial intelligence (AI), raising questions about the future relationship between AI and humans. The study, conducted by a team of researchers, introduced a formal method to test AI's personality traits, providing a scientific approach to understanding how AI makes choices and revealing its preferences beyond what is explicitly programmed. Surprisingly, in certain aspects, AI behaves more altruistically and cooperatively than humans. This discovery has led the researchers to express optimism rather than concern about the future implications of AI's behaviour.

Before this study, comparing AI with humans was limited to examining their outputs, as AI models are often considered 'black boxes'. However, the new method allows researchers to delve deeper into understanding how AI makes decisions, a crucial step before entrusting AI with high-stakes tasks like healthcare or business negotiations. Looking ahead, the researchers suggest several future research directions. They propose expanding behavioural tests, testing more AI models, and comparing their personalities and traits. Moreover, they advocate educating AI to represent the diversity of human behaviours and preferences, rather than an 'average human'.

The study's implications are significant, as they help people understand when and how they can rely on AI to make decisions. Increased trust in AI's capabilities could lead to its use in negotiation, dispute resolution, caregiving, and other tasks. However, the study also highlights the limitations of AI, particularly in tasks where the diversity of human preferences is crucial, such as product design, policymaking, or education.

The study opens up a new field of 'AI behavioural science', where researchers from different disciplines can collaborate to investigate AI's behaviours, its relationship with humans, and its impact on society.
