

Figure 1: Output of execution

```
# Where key is the store name, val is
the sale amount
# All the sales for a particular store
will be presented,
# then the key will change and we'll be
dealing with the next store

for line in sys.stdin:
    data_mapped = line.strip().
split("\t")
    if len(data_mapped) != 2:
        # Something has gone wrong. Skip
this line.
        continue
    thisCategory, thisSale = data_mapped

    if oldCategory and
oldCategory!=thisCategory:
        print "{0}\t{1}".
format(oldCategory,totalSales)
        totalSales = 0
        oldCategory = thisCategory

    oldCategory = thisCategory
    totalSales+=float(thisSale)
```

```
if oldCategory!=None:
    print "{0}\t{1}".
format(oldCategory,totalSales)
```

Figure 1 shows the output of the execution of the above code.

To conclude, with the increasing adoption of Big Data technologies, the demand for Big Data engineers is

expected to grow exponentially, creating a plethora of job opportunities in various industries. To succeed in this field, proficiency in programming languages like Java, Python, and Scala, as well as knowledge of Big Data technologies such as Hadoop and MapReduce, is essential. **END**
